## 1 Safety Instructions

Before you start working with the CL150, we recommend that you thoroughly familiarize yourself with the contents of this manual. Keep this manual in a place where it is always accessible to all users.

### 1.1 Intended Use

This instruction manual presents a comprehensive set of instructions and information required for the standard operation of the described products. The described products are used for the purpose of CL150.

The products described hereunder

- were developed, manufactured, tested and documented in accordance with the relevant safety standards. In standard operation, and provided that the specifications and safety instructions relating to the project phase, installation and correct operation of the product are followed, there should arise no risk of danger to personnel or property.
- are certified to be in full compliance with the requirements of the
- EMC directives (89/336/EEC 93/68/EEC, and 93/44/EEC)
- Low voltage directive (73/23/EEC)
- Harmonized standards EN 50081-2 and EN 50082-2
- are designed for operation in an industrial environment (Class A emissions), i.e.:
- Direct connection to the public low-voltage power supply is not permitted.
- Connection to the medium and/or high-voltage system must be provided by a transformer.

The following applies for application within a personal residence, in business areas, on retail premises or in a small-industry setting:

- Installation in a control cabinet or housing with high shield attenuation.
- Cables that exit the screened area must be provided with filtering or screening measures.
- The user will be required to obtain a single operating license issued by the appropriate national authority or approval body. In Germany, this is the Federal Institute for Posts and Telecommunications, and/or its local branch offices.

This is a Class A device. In a residential area, this device may cause radio interferences. In such case, the user may be required to introduce suitable countermeasures, and to bear the cost of the same.

Proper transport, handling and storage, placement and installation of the product are indispensable prerequisites for its subsequent flawless service and safe operation.

### 1.2 Qualified Personnel

This instruction manual is designed for specially trained personnel. The relevant requirements are based on the job specifications as outlined by the ZVEl and VDMA professional associations in Germany. Please refer to the following German-Language publication:

Weiterbildung in der Automatisierungstechnik
Hrsg.: ZVEl und VDMA
MaschinenbauVerlag
Postfach 710864
60498 Frankfurt
This instruction manual is specifically designed for PLC-technicians. The versions with fieldbus connection require special skills in handling the fieldbus system.

Interventions in the hardware and software of our products not described in this instruction manual may only be performed by our skilled personnel.

Unqualified interventions in the hardware or software or non-compliance with the warnings listed in this instruction manual or indicated on the product may result in serious personal injury or damage to property.

Installation and maintenance of the products described hereunder is the exclusive domain of trained electricians as per IEV 826-09-01 (modified) who are familiar with the contents of this manual.

Trained electricians are persons of whom the following is true:
They are capable, due to their professional training, skills and expertise, and based upon their knowledge of and familiarity with applicable technical standards, of assessing the work to be carried out, and of recognizing possible dangers.

They possess, subsequent to several years' experience in a comparable field of endeavor, a level of knowledge and skills that may be deemed commensurate with that attainable in the course of a formal professional education.

With regard to the foregoing, please read the information about our comprehensive training program. The professional staff at our training center will be pleased to provide detailed information. You may contact the center by telephone at $(+49)(06062) 78-258$.

### 1.3 Safety Markings on Components

Disconnect mains power before opening!

Lug for connecting PE conductor only!

Functional earthing or low-noise earth only!

Screened conductor only!

### 1.4 Safety Instructions in this Manual

DANGEROUS ELECTRICAL VOLTAGE
This symbol warns of the presence of a dangerous electrical voltage. Insufficient or lacking compliance with this warning can result in personal injury.

## DANGER

This symbol is used wherever insufficient or lacking observance of this instruction can result in personal injury.

## CAUTION

This symbol is used wherever insufficient or lacking observance of instructions can result in damage to equipment or data files.
$\Rightarrow$ This symbol is used to alert the user to an item of special interest.

### 1.5 Safety Instructions for the Described Product

## DANGER

Fatal injury hazard through ineffective Emergency-OFF devices! Emergency-OFF safety devices must remain effective and accessible during all operating modes of the system. The release of functional locks imposed by Emergency-OFF devices must never be allowed to cause an uncontrolled system restart!

Before restoring power to the system, test the Emergency-OFF sequence!

## DANGER

Danger to persons and equipment!
Test every new program before operating the system!

## DANGER

Retrofits or modifications may interfere with the safety of the products described hereunder!

The consequences may be severe personal injury or damage to equipment or the environment. Therefore, any system retrofitting or modification utilizing equipment components from other manufacturers will require express approval by Bosch.

## DANGEROUS ELECTRICAL VOLTAGE

Unless described otherwise, maintenance procedures must always be carried out only while the system is isolated from the power supply. During this process, the system must be blocked to prevent an unauthorized or inadvertent restart.

If measuring or testing procedures must be carried out on the active system, these must be carried out by trained electricians.

## CAUTION

Only Bosch-approved spare parts may be used!

## CAUTION <br> All ESD protection measures must be observed when using the module! Prevent electrostatic discharges!

Observe the following protective measures for electrostatically endangered modules (EEM)!

- The Employees responsible for storage, transport and handling must be trained in ESD protection.
- EEMs must be stored and transported in the protective packaging specified.
- Out of principle, EEMs may be handled only at special ESD work stations equipped for this particular purpose.
- Employees, work surfaces and all devices and tools that could come into contact with EEMs must be on the same potential (e.g. earthed). An approved earthing wrist strap must be worn. It must be connected to the work surface via a cable with an integrated $1 \mathrm{M} \Omega$ resistor.
- EEMs may under no circumstances come into contact with objects susceptible to accumulating an electrostatic charge. Most items made of plastic belong to this category.
- When installing EEMs in or removing them from an electronic device, the power supply of the device must be switched OFF.

### 1.6 Documentation, Versions and Trademarks

## Documentation

The present manual provides the user with comprehensive information about operation and installation of the CL150, CL151, CL150A, CL151A controllers and the versions with fieldbus connection -DP, -CAN, -IBS and -DEV. For further detailed information regarding the operation of B~IO modules, the programming unit software and other general information regarding the different fieldbus systems, please refer to the specific manuals.

## Versions

The CL150, CL151, CL150A, and CL151A versions and the ones with fieldbus connection DP, -CAN, -IBS and -DEV are different from each other only with regard to specific details. The description of the basic characteristics of the CL150 version represents the basic characteristics of all other versions. Differences are explicitly mentioned.

* This sign indicates the description of an action to be performed by the user.

## Trademarks

All trademarks referring to software that is installed on Bosch products when shipped from the factory represent the property of their respective owners.

At the time of shipment from the factory, all installed software is protected by copyright. Software may therefore be duplicated only with the prior permission of BOSCH or according to the license agreement of the respective manufacturer.

MS-DOS ${ }^{\circledR}$, Windows $^{\text {TM }}$, Windows $95^{\circledR}$, Windows $98{ }^{\circledR}$ and WindowsNT ${ }^{\circledR}$ are registered trademarks of Microsoft Corp.

PROFIBUS ${ }^{\circledR}$ is a registered trademark of PROFIBUS Nutzerorganisation e.V. (user organization).

INTERBUS-S ${ }^{\circledR}$ is a registered trademark of Phoenix Contact.
DeviceNet ${ }^{\circledR}$ is a registered trademark of ODVA (Open DeviceNet Vendor Association, Inc.).

## 2 System Overview

Fig. 2-1 CL150 Controller
The CL150 controller completes the Bosch PLC program below the CL200 performance category.

It is a low-priced but powerful compact controller of small dimensions for limited and quick local controlling tasks.

The module can be extended with components of the decentralized $\mathrm{B} \sim I O$ system because the CL150 is part of the B~IO system and offers the functionality of a PLC on this automation level.

Several versions of this compact basic device and the possibility of modular extension with B~IO components make it possible to adapt it specifically to the respective application purpose.

Versions with a fieldbus connection (Slave) make the integration into an integrated automation system and thus, the creation of a so-called decentralized intelligence possible.

## Areas of Application

- Handling devices
- Mounting systems
- Woodworking
- Special machines
- Mechanical engineering in general and other applications

## Overview of Versions

| Version | Digital In-/ and Outputs | Analog In-/ and Outputs | Serial Interfaces | Fieldbus Interface | Clock | Dimensions w xhxd (mm) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CL150 | $\begin{array}{\|l\|} \hline 8 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | V. 24 | none | no | $123 \times 105 \times 38$ |
| CL151 | $\begin{array}{\|l\|} \hline 16 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | $\begin{aligned} & \hline \mathrm{V} .24 \\ & \mathrm{~V} .24 / 20 \mathrm{~mA} \\ & \hline \end{aligned}$ | none | yes | $184 \times 105 \times 38$ |
| CL150A | $16 \mathrm{I}, 24 \mathrm{~V}$ | $2 \mathrm{I}, 0-10 \mathrm{~V}$ | V. 24 | none | yes | $184 \times 105 \times 38$ |
| CL151A | $8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A}$ | $\begin{aligned} & 1 \mathrm{O}, 0-10 \mathrm{~V}, \\ & +/-10 \mathrm{~V}, 20 \mathrm{~mA} \\ & \hline \end{aligned}$ | $\begin{aligned} & \hline \mathrm{V} .24 \\ & \mathrm{~V} .24 / 20 \mathrm{~mA} \\ & \hline \end{aligned}$ | none | yes | 184×105x38 |
| CL150-DP | $\begin{array}{\|l\|} \hline 8 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | V. 24 | DP-Slave | yes | $184 \times 105 \times 38$ |
| CL151-DP | $\begin{array}{\|l\|} \hline 8 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | $\begin{aligned} & \hline \mathrm{V} .24 \\ & \mathrm{~V} .24 / 20 \mathrm{~mA} \end{aligned}$ |  | yes | $184 \times 105 \times 38$ |
| CL150-CAN | $\begin{array}{\|l} \hline 8 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | V. 24 | CAN-Slave | yes | $184 \times 105 \times 38$ |
| CL151-CAN | $\begin{aligned} & 8 \mathrm{I}, 24 \mathrm{~V} \\ & 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \end{aligned}$ | none | $\begin{aligned} & \hline \text { V. } 24 \\ & \text { V. } 24 / 20 \mathrm{~mA} \end{aligned}$ |  | yes | $184 \times 105 \times 38$ |
| CL150-IBS | $\begin{array}{\|l} 8 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | V. 24 | Interbus-Slave | yes | $184 \times 105 \times 38$ |
| CL151-IBS | $\begin{array}{\|l\|} \hline 8 \mathrm{I}, 24 \mathrm{~V} \\ 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \\ \hline \end{array}$ | none | $\begin{aligned} & \hline \mathrm{V} .24 \\ & \mathrm{~V} .24 / 20 \mathrm{~mA} \\ & \hline \end{aligned}$ |  | yes | $184 \times 105 \times 38$ |
| CL150-DEV | $\begin{aligned} & 8 \mathrm{I}, 24 \mathrm{~V} \\ & 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \end{aligned}$ | none | V. 24 | DeviceNet-Slave | yes | $184 \times 105 \times 38$ |
| CL151-DEV | $\begin{aligned} & 8 \mathrm{I}, 24 \mathrm{~V} \\ & 8 \mathrm{O}, 24 \mathrm{~V} / 0.5 \mathrm{~A} \end{aligned}$ | none | $\begin{aligned} & \hline \mathrm{V} .24 \\ & \mathrm{~V} .24 / 20 \mathrm{~mA} \end{aligned}$ |  | yes | $184 \times 105 \times 38$ |

In comparison to the CL150 versions, CL151 versions are provided, in addition to the programming unit interface, with a second serial interface.

### 2.1 Structure

Fig. 2-2 Modular Structure
The CL150 programmable logic controller is a compact controller with the possibility of modular extension.

## Compact Controller

As a compact device, the CL150 comprises all functions of a programmable logic controller:

- Power supply module for providing the entire internally necessary power supply.
- I/O-Interface, digital and analog, quantity according to version
- V. 24 interface for connection of programming units
- 2. serial interface, V. 24 or 20 mA passive, for all CL151 versions, e.g. for connecting an operator terminal
- All elements of the control function
$\Rightarrow \quad$ In fieldbus versions, the fieldbus connection is integrated as well.

## Modular Extension

In addition, the modules of the $\mathrm{B} \sim 1 \mathrm{O}$ - modular system make it possible to adapt the controller to the respective I/O related requirements. Thus, later extensions and modifications can be realized very easily.

With the CL150, any module of the B~IO M- modular system may be used. The modules are connected with each other and with the CL150 by means of module connectors.

Up to 16 modules can be connected in series if the current at the module interface does not exceed 0.5 A.

## B~IO-Modules

| Description | Order No. |
| :--- | :--- |
| Module connector | 1070079782 |
| 8DI, digital input module, 8 inputs, 24 V | 1070079757 |
| 16DI, digital input module, 16 inputs, 24 V | 1070080144 |
| 16DI-3, digital input module, 16 inputs, 3-wire connection, 24 V | 1070081862 |
| 8DO, digital output module, 8 outputs, 24 V, 0.5 A | 1070079759 |
| 8DO/2A, digital output module, 8 outputs, 24 V, 2 A | 1070080151 |
| 16DO, digital output module, 16 outputs, 24 V, 0.5 A | 1070081858 |
| 8DI/DO, digital combination module, 8 in- or outputs, 0.5 A | 1070080709 |
| 8DO R, output module, 8 outputs, relay | 1070080680 |
| 4AI_UI, analog input module, 4 inputs, voltage and current | 1070080524 |
| 4AI_UIT, analog input module, 4 inputs, voltage, current and <br> thermoelement | 1070080526 |
| 4AO_I, analog output module, 4 outputs, current | 1070080528 |
| 4AO_U, analog output module, 4 outputs, voltage | 1070080530 |
| I/O-Gateway, for coupling of two fieldbus systems | 1070083150 |

For descriptions and technical data of the modules, please refer to the catalogue "Installation Engineering" order no. 1070072190.

## Mounting

The CL150 and the modules of the B~IO group are provided with a very robust metal housing, suitable for industrial usage, protection category IP20. They are placed directly on a $35 \times 7.7 \mathrm{~mm}$ support rail as per EN 50022.

In order to comply with the IP65 requirements outside of control cabinets, additional housings can be used.

Actuators and sensors are connected by means of socket connectors. Three different systems are offered:

- Screw terminal
- Spring clamp terminal
- Top screw terminal

For connecting sensors with 3- or 4-wire connections, optional two-tier terminal blocks are available.

### 2.7 Order Numbers

| Designation | Order No. |
| :--- | :--- |
| CL150 | 1070080502 |
| CL151 | 1070081487 |
| CL150A | 1070081306 |
| CL151A | 1070081457 |

## 3 Module Description

### 3.1 Connections

### 3.1.1 24V Power Supply

Fig. 3-1 Connections Power Supply
The 24 V power supply is connected to the X10A as follows:

- Ul for logic circuits, input circuits and sensor power
- UQ for digital outputs

The voltages are galvanically coupled.
The 0V connection at X 10 B is the same for all supply voltages. The three pins are jumpered internally.

The current input at UI is composed of the need of current for the internal logic circuits, the switched digital inputs and the loads connected to the 24 V sensor power.

Both pins for UQ are jumpered internally. The current input depends on the output load, nominal load $=0.5 \mathrm{~A}$.

The functional earth X10B is lead to the enclosure of the module and functions as a shielding potential. The coupling with the internal voltages is only capacitive.

| Technical Data | CL150 | CL151 | CL150A | CL151A |
| :---: | :---: | :---: | :---: | :---: |
| Power supply as per DIN EN 61131-2 <br> - Nominal voltage <br> - Min. <br> - Max. | $\begin{gathered} 24 \mathrm{~V}- \\ 19.2 \mathrm{~V} \\ 30 \mathrm{~V} \end{gathered}$ |  |  |  |
| Jumpering of power interruptions | Class PS2, $\leq 10 \mathrm{~ms}$ repetition rate $\geq 1 \mathrm{~s}$ |  |  |  |
| Current input at UI <br> - without load on the sensor power supply <br> - with nominal load on the sensor power supply | $\begin{aligned} & \leq 0.6 \mathrm{~A} \\ & \leq 1.2 \mathrm{~A} \end{aligned}$ |  |  |  |
| Peak switch-on current |  |  | $\leq 25 \mathrm{~A}$ |  |
| Active time of peak switch-on current | $\leq 5 \mathrm{~ms}$ |  |  |  |

### 3.1.2 24V Sensor Power Supply X21A/X22A

The CL150 provides a 24 V power supply for up to 8 sensors (CL151, CL150A and CL151A for up to 16).

The pins of the sensor power supply are connected with each other in the module.

The sensor power supply is monitored with regard to short circuits and overload. In case of a short circuit, the output current will be limited.

| Technical Data | CL150 | CL151 | CL150A |
| :--- | :---: | :---: | :---: | CL151A 9.

### 3.1.3 Digital Inputs X21B/X22B

8 X21B inputs have been provided for sensors.
CL151, CL150A, CL151A are provided with 8 additional X22B inputs.
The electric circuits of the inputs are galvanically coupled with the internal logic circuits.

The control state can be read at the associated status LEDs.

The addresses of the integrated inputs are defined as follows:

- Inputs at X21B, byte address 0 / bit addresses 0.0-0.7
- Inputs at X22B, byte address 1 / bit addresses 1.0-1.7

| Technical Data | CL150 | CL151 | CL150A | CL151A |
| :---: | :---: | :---: | :---: | :---: |
| Inputs | 8 |  | 16 |  |
| Type | Type1 as per DIN EN61131-2 |  |  |  |
| Electrical isolation | no |  |  |  |
| Reverse voltage protection | yes |  |  |  |

| Input current <br> - 0-Signal <br> - 1-Signal | $\begin{gathered} \leq 2.5 \mathrm{~mA} \\ 2.8 \text { to } 6 \mathrm{~mA} \end{gathered}$ |  |  |  |
| Delay interval <br> - $0 \rightarrow 1$ <br> - $1 \rightarrow 0$ | $\begin{gathered} 3.5 \mathrm{~ms} \\ 2 \mathrm{~ms} \end{gathered}$ |  |  |  |
| Contact rating | max. 8 A per contact / $\mathrm{T}_{U}=55^{\circ} \mathrm{C}$ |  |  |  |
| Cable length, unscreened | max. 100 m |  |  |  |
| Connector pin spacing | 3.5 mm |  |  |  |
| 2-wire proximity switch <br> - Closed circuit current <br> - Voltage drop | $\begin{gathered} \leq 2.5 \mathrm{~mA} \\ \leq 8 \mathrm{~V} \end{gathered}$ |  |  |  |

### 3.1.4 High-Speed Inputs

## General Information

Parallel to the standard input circuits, the inputs $10.0-10.3$ are lead to the logic circuits via high-speed comparators.

Thus, these inputs are suitable for high-speed interrupt- and counter functions.
$\Rightarrow$ Please note that high-speed input circuits are more susceptible to interferences than standard circuits. If necessary, use shielded cables.

| Technical Data | CL150 | CL151 | CL150A |
| :--- | :---: | :---: | :---: |
| High-speed inputs |  | CL151A |  |
| Delay interval |  |  |  |
| $\bullet \bullet \quad 0 \rightarrow 1$ | $18 \mu \mathrm{~s}$ |  |  |
| $\bullet \quad 1 \rightarrow 0$ | $15 \mu \mathrm{~s}$ |  |  |
| Trigger pulse edge <br> $\bullet \quad$ for interrupt inputs <br> $\bullet \quad$ for counter inputs |  |  |  |
| Pulse duration |  | positive edge <br> adjustable |  |
| Frequency counter inputs | $\geq 50 \mu \mathrm{~s}$ |  |  |
| additional data | $\leq 10 \mathrm{kHz}$ |  |  |

## Usage as Interrupt Inputs

The inputs $10.0-10.2$ can be used as interrupt inputs, please refer also to 7.5.2 Event-Controlled Program Processing OM10/OM11/OM12.

A rising edge causes the insertion of an interrupt module into the process of the application program.

Fig. 3-2 Interrupt Inputs CL150
The interrupt function works parallel to the standard input function.
A previous special configuration is not necessary; releasing the interrupts and including the respective interrupt OM is sufficient.

The interrupt inputs are processed via the OM10 to OM12 organization modules.

The interrupt response times are dependent on a number of circumstances; among others, also on the number and type of the used $\mathrm{B} \sim I O$ modules. Without using $\mathrm{B} \sim 1 \mathrm{O}$ modules, a maximum interrupt response time of 1.1 ms can be expected; the typical time is 0.6 ms .

## Usage as Counter Inputs

The input pairs 10.0 / I0.1 and I0.2 / I0.3 can be each configured as pulse/directional inputs for 32-bit bi-directional counters with a counting frequency of up to 10 kHz .

Fig. 3-3 Counter Inputs CL150

The counters are programmed in OM2 and controlled via the system area.

They have 2 limit values each. When these limits are reached, integrated, in OM2 defined outputs are set.

The counter and interrupt functions of a pair of inputs can only be used alternatively, i.e. that even if directional switching is not used, the associated input is assigned to the counter function and cannot be used as an interrupt.

Counter 1 (I0.2 / I0.3) is suitable for realizing an incremental encoder interface with a counting frequency of up to 10 kHz .

### 3.1.5 Digital Outputs X11A/X11B

At the X11A push-on terminal strip, 824 V semiconductor outputs are available, while the X11B push-on terminal strip is reserved for the relating zero potential.

8 actuators with a nominal current input of up to 0.5 A each can run contemporarily. The outputs can be switched parallel.

The circuit state is indicated at the relating status LEDs.
In case of a stop of the controller or in case of voltage failure the output signals are set back, secure state.

The outputs are galvanically coupled among each other and with the internal logic circuits.

The outputs are secured with an overload protection. At typical 1.2 A (minimum 0.6 A) the output switches off. If the load current has been reduced accordingly, an automatic restart occurs after approximately 10 ms .

If the overload protection is addressed by one or more outputs, a diagnostic group signal is sent to the operating system. It can also be evaluated in the application program, please refer to 7.7 System Area.

The 0 V reference potential of connected loads must be returned to the 0 V terminal of the outputs. A two-wire load connection must be established. If the 0 V reference potential is not returned (single-wire connection), GND continuity will not be ensured.

When output cables are under power, do not plug them in or out.
The address of the integrated outputs is determined: byte address 0 , bit address 0.0-0.7.

The direct connection of outputs to type 1 inputs is possible.

Technical Data of the Digital Outputs

| Technical Data | CL150 | CL151 | CL150A | CL151A |
| :---: | :---: | :---: | :---: | :---: |
| Digital outputs integrated | 8 |  |  |  |
| type | semiconductor outputs, non-latching, protected, with automatic restart, with power output |  |  |  |
| Electrical isolation | no |  |  |  |
| Output voltage | Nominal value 24 V , voltage drop with HIGH signal $\leq 1.5 \mathrm{~V}$ |  |  |  |
| Rated current <br> - Nominal value <br> - HIGH signal <br> - LOW signal, leakage current | $\begin{gathered} 0.5 \mathrm{~A} \\ 2 \mathrm{~mA}-0.6 \mathrm{~A} \\ \leq 0.5 \mathrm{~mA} \\ \hline \end{gathered}$ |  |  |  |
| Coincidence (simultaneity) factor | 100 \% |  |  |  |
| Parallel switching of outputs | yes |  |  |  |
| Overload protection <br> - Minimum current that leads to switch-off <br> - Automatic restart after | $\begin{gathered} >0.6 \mathrm{~A}, \text { typ. } 1.2 \mathrm{~A} \\ 10 \mathrm{~ms} \end{gathered}$ |  |  |  |
| Output delay interval | $<500 \mu \mathrm{~s}$ |  |  |  |
| Lamp load | 5 W at 8 Hz |  |  |  |
| Switching frequency <br> - Resistive load <br> - Inductive load | $100 \text { Hz }$ <br> dependent on contactor function |  |  |  |
| Inductive cut-off voltage | typ. -26 V |  |  |  |
| Contactor size at 1Hz | SG1; 6.2 W |  |  |  |
| Contact rating | max. 8 A per contact / $\mathrm{T}_{\mathrm{U}}=55^{\circ} \mathrm{C}$ |  |  |  |
| Cable length, unscreened | 100 m |  |  |  |
| Connector pin spacing | 3.5 mm |  |  |  |

### 3.1.6 Connection of B~IO Modules, Addressing of Modules

The B~IO modules are connected to the X51 push-on terminal strip by module connectors (ribbon cable).

| Designation | Order No. |
| :--- | :--- |
| Module connectors | 1070079782 |

Up to 16 modules can be connected in series in any order.
The internal logic of the modules is supplied with a $5-\mathrm{V}$ voltage which is available at the push-on terminal strip.

The total current input of all modules connected to this 5-V power supply must not exceed 0.5 A. For information about the single current input of each module, please refer to the corresponding module description.

The modules are addressed only within the input/output cycle of the controller. The possibility of direct access is not available.

The possibility of setting an address on the modules is not available.

## Automatic Address Assignment

If the $B \sim I O$ modules have not been specifically configurated, the operating system of the PLC automatically assigns addresses to all connected B~IO modules.

Consecutive input addresses are assigned to the input modules from left to right according to the order of their setting, starting at byte address 2. For this process, the data width of each module will be considered.

Consecutive output addresses are assigned to the output modules from left to right according to the order of their setting, starting at byte address 1. For this process, the data width of each module will be considered. Word modules always receive even-ordered byte addresses.

Modules with in- and outputs receive equal input- and output starting addresses.

Because of these rules, the occurrence of gaps in the address areas of the I/O modules is possible.

Complying with these rules, assigning addresses to the modules is very easy.

With the programming unit, the automatically processed address assignment can also be read out of the controller:

WinSPS $\rightarrow$ Editor $\rightarrow$ Process $\rightarrow$ I/O Configuration (OM3)

Example of Automatic Address Assignment

Fig. 3-4 Example of Automatic Address Assignment

## Configuration of the I/O-Addresses

Optionally, modules can also be assigned with addresses that are different from those automatically assigned ones.

To do so, enter the module configuration by using the programming software:

WinSPS $\rightarrow$ Editor $\rightarrow$ Process $\rightarrow$ I/O Configuration OM3
Within the scope of the controller's address range, the modules can be given the addresses that are necessary for the application. But also in this case, the following rules apply:

- Word modules require even-ordered byte addresses
- Combination modules have equal input and output addresses

The configuration tool stores the module configuration in the CL150 OM3 configuration module which will be linked to the application program and then loaded, together with the program, into the controller.

The operating system of the controller provides a configuration monitoring function. If this function is active, during startup, the desired configuration entered with the configuration tool is automatically compared to the physically existing actual configuration. In case the two values are not conform, the controller does not start and the „Conflict in module configuration diagram" error message will be given out.

## Device Data Base File DDBF

The above described I/O-configuration tool requires information about the $\mathrm{B} \sim 1 \mathrm{O}$ modules which are to be connected to the CL150.

Since the B~IO system is subject to constant development, new modules might be added to the system. Thus, this information is located in the CL150 Device Data Base File (DDBF) which can always be updated if necessary.

The CL150 DDBF carries the designation:
Rbxx0119.GSD; xx represents the two digit version identification.
The DDBF is included in the WinSPS program package and is stored in the WinSPS directory during installation.

The DDBF can be updated by copying the new version into the ...IWinSPS directory.
$\Rightarrow$ In WinSPS versions < V3.0, the old DDBF in the
...IWINSPS directory must be deleted.

### 3.1.7 Programming Unit Interface X31

The programming unit is connected via X31, a 9-pin D-SUB connector.
It is a V.24-interface.
The interface is not electrically isolated.

## Transfer Format

## Protocol

The protocol BUEP19E is used, PST function only.

## Level

Signal level: logic $1 \quad-5 \mathrm{~V}$
logic $0 \quad+5 \mathrm{~V}$
The difference between the potential of the transmitter and that of the receiver shall not exceed $-2 \mathrm{~V}<$ Udiff $<+2 \mathrm{~V}$.

## Interconnecting Cable

The parameters of the interfaces are permanently set and cannot be modified:
19200 baud, even parity, 8 databits, 1 stopbit.
Control lines are not available.

As an interconnecting cable, a screened and twisted-conductor cable of $7 \times 0.14 \mathrm{~mm}^{2}$ or $14 \times 0.14 \mathrm{~mm}^{2}$ is to be used. Do not exceed the following values:

- Resistance $0.2 \Omega / \mathrm{m}$
- Capacitance $120 \mathrm{pF} / \mathrm{m}$
- Length 15 m

Pin assignment X31:

| Pin No. | Designation | Note |
| :---: | :--- | :--- |
| 1 |  | not applicable |
| 2 | RxD |  |
| 3 | TxD |  |
| 4 |  | not applicable |
| 5 | SIGGND |  |
| 6 |  | not applicable |
| 7 |  | not applicable |
| 8 |  | not applicable |
| 9 |  | not applicable |

An interconnecting cable set with a length of 5 m is available.

| Designation | Order no. |
| :--- | :--- |
| K19, COM Interface CL150 | 1070077753 |

### 3.1.8 Serial Interface X32

The versions CL151 and CL151A are provided with a 2 . serial interface.
Primarily designed for the connection of an operator terminal, it is nevertheless possible to connect all peripheral devices that use the BUEP19E transmission protocol.

The interface is a combined interface: V. 24 and 20 mA passive current loop.

The V24 interface is not electrically isolated.
The 20 mA interface is optically isolated.

## Transfer Format

The parameters of the interfaces are preset: 19200 baud, even parity, 8 databits, 1 stopbit.

The baud rate can be reduced to 9600 baud via the OM2, so that, when using the 20 mA interface, a cable length of up to 300 m is possible.

Control lines are not available.

## Protocol

The protocol BUEP19E is used, PST function only.

## Level V. 24

Signal level logic $1 \quad-5 \mathrm{~V}$

$$
\begin{array}{ll}
\text { logic } 0 & +5 \mathrm{~V}
\end{array}
$$

The difference between the potential of the transmitter and that of the receiver shall not exceed $-2 \mathrm{~V}<$ Udiff $<+2 \mathrm{~V}$.

## 20 mA Passive

The connected peripheral device must provide the power source.
$\begin{array}{lll}\text { Line status: } & \text { logic } 1 & 20 \mathrm{~mA} \\ & \text { logic } 0 & \text { no current }\end{array}$

## Interconnecting Cable

As an interconnecting cable, a screened and twisted-conductor cable of $7 \times 0.14 \mathrm{~mm}^{2}$ or $14 \times 0.14 \mathrm{~mm}^{2}$ is to be used. Do not exceed the following values:

- Resistance $0.2 \Omega / \mathrm{m}$
- Capacitance 120 pF/m
- Max. Length V. $24 \quad 15$ m
$20 \mathrm{~mA} \quad 150 \mathrm{~m}$
with 19200 baud
300 m with 9600 baud

X 32 is a 9-pin D-SUB push-on terminal strip with the following assignment:

| Pin No. | Designation | Note |
| :--- | :--- | :--- |
| 1 |  | not applicable |
| 2 | RxD |  |
| 3 | TxD |  |
| 4 |  | not applicable |
| 5 | SIGGND |  |
| 6 | RxD + | 20 mA |
| 7 | RxD- | 20 mA |
| 8 | TxD+ | 20 mA |
| 9 | TxD- | 20 mA |

The type of the interface can be selected by using the corresponding interconnecting cable.

### 3.1.9 Analog Inputs X23/X24

Each of the versions CL150A and CL151A is provided with 2 analog voltage inputs as per DIN EN 61131-2. The input circuits are not electrically isolated, but the analog inputs are protected against overloads and reverse voltage. An additional power supply is not required.

The analog inputs are monitored with regard to cable breaks.
The data of the analog inputs and the messages regarding cable breaks are available in the system area; also refer to 7.7 System Area.

Under overload conditions, the minimum and/or maximum digital value is output.

| Technical Data | CL150A |
| :--- | :---: |
| Integrated analog inputs as per <br> EN 61131-2 | 2 |
| Input voltage | 0 to 10 V, unipolar <br> can be standardized to 2 to 10 V |
| Electrical isolation | no |
| Input resistance | $20 \mathrm{k} \Omega$ |
| Resolution | 10 bit |
| LSB value | 9.8 mV |
| Digital display | 16 bit, left justified, straight binary |
| Temperature coefficient | $1 \%, 0$ to $55^{\circ} \mathrm{C}$ |
| Maximum deviation under the <br> influence of interferences, as <br> per EN 61131-2 | $<2 \%$ |
| Conversion time | cycle time +10 ms |
| Scanning time | $20 \mu \mathrm{~s}$ |
| Scanning repeat time | 10 ms |
| Cable length | max. 100 m, shielded |

## Averaging

In order to filter out short-term interferences, an averaging function can be turned on in the OM2 by means of 4 scanning values. The conversion time will not be influenced by this.

Ex works, the averaging function is switched off.

### 3.1.10 Analog Output X12/X13

The versions CL150A and CL151A provide a short circuit-safe analog output. The analog output value can be picked up at the X12 push-on terminal strip as a voltage level or at the X13 push-on terminal strip as a current level. The parameters are set in the dataword 32 of the OM2, see also 6.3 Initialization Module OM2.

An additional external power supply is not required. The analog output interfaces are not electrically isolated.

## Operation

The D/A conversion will start when a dataword is written into the S82/S83 address of the system area. The output is started with the following I/O image; see also 7.7 System Area.

| Technical Data | CL150A ${ }^{\text {a }}$ CL151A |
| :---: | :---: |
| Integrated analog output as per EN 61131-2 | 1 |
| Electrical isolation | no |
| Output area <br> - Voltage output <br> - Current output | 0 to 10 V , unipolar <br> can be standardized to 2 to 10 V <br> +/- 10 V bipolar <br> 0 to 20 mA <br> can be standardized to 4 to 20 mA |
| Admissible load impendance <br> - Voltage output <br> - Current output | $\begin{gathered} \geq 1000 \Omega \\ \leq 600 \Omega \end{gathered}$ |
| Short-circuit current at the voltage output | 32 mA |
| Output impendance in the signal area <br> - Voltage output <br> - Current output | $\begin{aligned} & 24.9 \mathrm{k} \Omega \\ & 11.6 \mathrm{k} \Omega \end{aligned}$ |
| Resolution | 12 Bit |
| Digital display | 16 bit, left-justified, straight binary |
| LSB value <br> - Voltage output <br> - Current output | $\begin{array}{r} 2.4 \mathrm{mV} \\ 4.9 \mu \mathrm{~A} \\ \hline \end{array}$ |
| Conversion time | Cycle time + $16 \mu \mathrm{~s}$ |
| Settling time upon reaching of established value | $<2 \mathrm{~ms}$ |
| Overswing | no overswing |
| Monoticity | yes |
| Non-linearity | < +/-1 LSB |
| Repeatability | > 99 \% |
| Temperature coefficient | $1 \%$ at 0 to $55{ }^{\circ} \mathrm{C}$ |
| Output ripple | < 100 mVpp |
| Max. short-time deviation under the influence of interferences | < 2 \% |
| Cable length | max. 100 m , shielded |

### 3.2 LED Displays

The UL LED indicates the proper operational status of the logic circuits (hardware) and the battery backup.

The MODE LED indicates the status of the controller's operating system.
Explanations:

| $O$ | LED is not lit. |
| :--- | :--- |
| - | LED is lit. |
| - | LED flashes. |
| - | Display of LED is not significant. |

| UL | MODE | Significance |
| :--- | :--- | :--- |
| green | - | Controller is ready for operation |
|  | $\bullet$ green | Controller in operating mode Run |
|  | - | Low battery warning |
|  | O red | Battery failure |
|  | O | System error, Restart is required |

Independent from the status of the UL LED, for the MODE LED the following is applicable:

| MODE | Significance |
| :--- | :--- |
| green | Run and outputs are disabled or fixed. |
| yellow | Stop, cause for Stop in Infostatus |
| yellow | System error, Service-Code possibly in Infostatus |
| yellow /green | Copy function with Store or Recall is active |
|  | Ered |

### 3.3 Switches and Buttons

## Toggle Switch S1 Stop/Run

## Basic Function

| Position up | Controller in Stop status |
| :--- | :--- |
| Position down | Controller in Run status if no other cause for <br> Stop is present. |

Secondary functions in relation with pressing the COPY/Bat. button:

| Switch from Stop to Run | If controller is in Store mode: |
| :--- | :--- |
|  | Activates the Store function; also refer to <br> 5.4 .3 Flash Memory. The current status of the <br> application program and the user data is <br> copied to the non-volatile backup memory. <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> Activates the Recall function; also refer to <br> 5.4.3 Flash Memory. Application program and <br> user data are copied from the backup <br> memory to the random access memory; the <br> backup memory will then be deleted. |

Button S2 Copy/Battery
$\left.\begin{array}{|l|l|}\hline \begin{array}{l}\text { Press button in Run } \\ \text { status }\end{array} & \begin{array}{l}\text { If battery-powered, a battery load test will be } \\ \text { performed. As an acknowledgement for } \\ \text { having pressed the button the MODE LED will } \\ \text { be yellow for approx. } 5 \mathrm{~s} \text {; also refer to 6.1.2 } \\ \text { Operation. } \\ \text { In case no battery is used for operation, } \\ \text { pressing the button in the Run status has no } \\ \text { consequences. }\end{array} \\ \hline \begin{array}{l}\text { Press button in Stop } \\ \text { status }\end{array} & \begin{array}{l}\text { - If battery-powered, a battery load test will } \\ \text { be performed. }\end{array} \\ \text { - The controller goes into Store mode, } \\ \text { also refer to 6.2.3 Special States. The } \\ \text { MODE LED is yellow. The Store mode } \\ \text { will be active for about 5 s, afterwards } \\ \text { the controller automatically goes into } \\ \text { Stop status. }\end{array}\right\}$

### 3.4 Backup Battery

For backing up the user data when switching off the power supply, an optional battery can be used.

## Battery

The lithium battery (1/2 AA, 3.6 V/0.85 Ah) is, together with a device for its removal, available as an accessory.

| Designation | Order No. |
| :--- | :--- |
| Backup battery for CL150/151/150A/151A | 1070081777 |

## Battery Maintenance Recommendations

The battery is only under significant load when the 24 V supply of the controller is switched off.

Taking into consideration a typical backup power requirement of $3 \mu \mathrm{~A}$, the time for simple data storage - controller without 24 V power supply - can be expected to last for up to 3 years.

If the power supply is available most of the time - normal application expect the following battery maintenance intervals:

| 1-shift operation | 40 h operation / 128 h backup per week | 4 years |
| :--- | :--- | :--- |
| 2-shift operation | 80 h operation $/ 88 \mathrm{~h}$ backup per week | 6 years |
| 3- shift operation | 120 h operation / 48 h backup per week | 10 years |

These recommendations are valid for an ambient temperature of up to $55^{\circ} \mathrm{C}$.

The manufacturer indicates a battery life of 10 years.
We recommend to check the battery status by using the application program, also refer to 7.7 System Area. In case of a Low Battery Warning, the battery should be changed.

Battery Case
The battery case is located on the back of the module housing.

Battery Change

## CAUTION Loss of Data

Removing the backup battery while the 24 V power supply is switched off leads to the loss of all remaining data and the PLC program in the RAM!
Change the backup battery only when the 24 V power supply is switched on or store data temporarily in the flash memory using the Store and Recall function.

* Press the cover of the battery case lightly together and remove.
* Remove old backup battery.

## CAUTION! Short circuit risk!

Do not use any metal tools. Use the included removal device only!

* Hit new backup battery lightly onto a resistant pad in order to deactivate the internal oxide film!
* Insert new backup battery. Make sure that polarity is correct.
* Put battery case cover back on.
$\Rightarrow \quad$ The old lithium backup battery must be disposed according to the local toxic waste disposal regulations. Comply with the regulations of the landfill area.

### 3.5 Real Time Clock

The versions CL151, CL150A and CL151A are provided with a real time clock that indicates date, time and day of the week.

The clock module is battery-backed so that, when using a battery, the clock keeps on running even if the 24 V power supply of the controller is switched off. This backup is independent from the operating mode "operation with battery".

If no battery has been put in, the clock will be set to 1.1 .00 0:0:0 when the controller is switched on (day of the week is invalid).

The clock can be set either with WinSPS or with the application program, also refer to 7.8 Setting of Time.

The time is displayed in the system area of the controller and can be used in the application program.

## 4 Installation

### 4.1 Mechanical Installation

## Fixation

The CL150 and the B~IO modules are put directly onto a $35 \times 7.5 \mathrm{~mm}$ support rail as per EN 50022. In order to facilitate the installation and deinstallation, it is recommended to keep a distance of 2 cm above and underneath the modules.

## Mounting

First, hang the CL150 into the support rail's top, then let it snap in at the bottom. Due to the spring pressure of the housing's back, the module is securely fastened.

Dismounting
CAUTION! Damage to the connector of the modules! Prior to dismounting take off the module connector (ribbon cable) that connects the controller with the neighboring B~IO module.

In order to dismount the CL150, press the unit downwards to overcome the spring pressure (1). This way, the lower enclosing claw can be unsnapped and the module can be lifted off the support rail.

Make sure that the connectors are labeled. This way you can prevent unintentional connector misplacement upon installation.

### 4.1.1 Installation under Thermal and Mechanical Aspects

The service life of electronic devices such as the B~IO depends considerably on the ambient temperature in which they are operating. As high temperatures will cause a more rapid aging of all electronic components, special care must be taken to provide an ambient operating temperature that is as moderate as possible. Consider also the installation of air condition devices.

The ambient temperature is determined by measuring the fresh air in the middle of a module's lower side.

## Installation Orientation

The following installation orientations are permitted:

- Normal orientation, on edge, horizontal, programming unit's interface located on bottom left, operation up to an ambient temperature of $55^{\circ} \mathrm{C}$.

- On edge, vertical, programming unit's interface located on bottom, operation up to an ambient temperature of $45^{\circ} \mathrm{C}$.

If the unit is installed this way, the extension with B~IO modules is not permitted.

- Lying on its back, front up, operation up to an ambient temperature of $45^{\circ} \mathrm{C}$.

Sufficient space must be provided for mounting and dismounting and for the cable ports. In addition, make sure that the ambient air can always circulate.

In case of a multi-tier installation, the temperature of the fresh air under each tier must be measured and the limit values must be observed.

## Labeling Fields

## 2-,3- or 4-Wire Connections

For connecting the sensors and actuators, the CL150 is provided with terminals for 2-wire connections.

The standard 2-wire terminals can be easily extended to 3 or 4 -wire connections by means of plug-on two-tier terminal blocks (accessories). This arrangement will not require any further wiring subdistribution. Also refer to 4.2.4 Connection of Peripherals.

The terminal block adds 4 cm to the vertical dimension of the module.

### 4.2 Electrical Installation

## General Standards

When installing a system that employs electrical devices such as controllers, comply with the following standards:

- DIN VDE 0100
- VDE 0113 (= EN 60204 Part 1 or IEC 204-1)
- VDE 0160 (= EN 50178)

## Danger!

Danger to persons and equipment!
Hazardous system conditions that could cause personal injury or property damage must be prevented!
Strict adherence is required to the regulations governing the configuration and installation of Emergency-STOP devices, as per EN 60204-1!
Uncontrolled restart of machinery upon restoration of power, e.g. subsequent to an Emergency-STOP occurrence, must not be possible!
The prescribed measures (connection to PE conductor, insulation, etc.) must ensure protection against damages and injuries that can result from direct or indirect contact!

### 4.2.1 Power Supply

The CL150 is supplied with power through the 24 V industrial mains.
The power supply unit must feature a transformer with protective separation as per DIN VDE 0551, and the offset AC voltage components (ref. to EN 61131-2) must not exceed $5 \%$. A 3-phase power supply unit with single full-bridge rectification is sufficient. This provided, the 24 V power supply net is then considered to be an extra low voltage with protective separation as per EN50178 section 5.2.8.1. The power can be supplied as Safety Extra Low Voltage = SELV without earthing of the reference conductor or as Protective Extra Low Voltage = PELV with earthing of the reference conductor. All cables of the 24 V system's electric circuits must be

- installed separately from cables with higher voltage
or
- specially insulated, with the insulation being at least suitable for the highest voltage encountered, EN 60204 part 1, section 15.1.3.

## Earthing of the Power Supply System

Basically, power supply circuits can be installed with or without earth. Two examples:

## Reference Conductor Connected to Earth

If the reference conductor ( $\mathrm{N}, 0 \mathrm{~V}$ ) is connected to the PE conductor system, this connection must be located centrally (at the load power supply unit or at the isolating transformer) and it must be interruptible in order to measure the earth leakage current. This type of connection is to be preferred.

Fig. 4-2 24V Supply, Reference Conductor Connected to PE Conductor

## No Connection Between Reference Conductor and PE Conductor

If the reference conductor ( $\mathrm{N}, 0 \mathrm{~V}$ ) is not be connected to the PE conductor system, an earth leakage monitor must be used for the recognition of earth faults in order to prevent unintentional switch-on in case of insulation faults.

Fig. 4-3 24V Supply, Reference Conductor Is Not Connected to PE Conductor

Isolated and Non-Isolated Circuits
All electric circuits of the CL 150 are galvanically connected. Only the bus connections of the fieldbus versions are galvanically isolated from the power supply. The in- and output bus interfaces of the interbus are even insulated against each other.

## Capacitive Load of the Power Supply Network

In order to suppress interferences, capacitances are put between the supply power lines and the earth. This is to be considered when using an earth leakage monitor. In particular, the following capacitances are used:

| Connection | Capacitance to earth |  |
| :---: | :---: | :---: |
|  | CL150 | CL151, CL150A, CL151A |
| UI | 4.7 nF | 220 nF |
| UQ | 4.7 nF | 220 nF |
| OV | 9.4 nF | 224.7 nF |

## Operation with One Power Supply Unit

It is also possible to supply the logic circuits and the output loads mutually from one power supply unit only.

Fig. 4-4 $24 V$ Supply from One Power Supply Unit

## Power Supply Rating

The rating of the power supply must account for the maximum currents, as per VDE 0100 part 523 . The specified supply voltage of 24 V (+20\%/-15\%) must be applied directly at the device input, taking into consideration

- mains voltage fluctuations which are due e.g. to varying mains loads
- varying load conditions such as short circuit, standard load, lamp load or idle status.
The maximum cross-section of the power supply lines is $1.5 \mathrm{~mm}^{2}$.

## Master Switch

For the CL150, the sensors and actuators, a master switch conforming to VDE 0100 must be provided.

## Fuses

Fuses and circuit breakers protect the lines in an electrical network. In general, the lines used for the wiring of the power supply must be protected. The lines for the sensors and actuators should be protected separately. Please refer to the next paragraph for selective criteria regarding such fuses. Only if the lines used for further subdistribution are shorter than approximately 3 m and inherently earth fault and short circuit proof, additional fuses in these lines are not necessary.

## Basic Information Regarding the Selection of Fuses

When selecting fuses, a number of aspects has to be considered. The most important parameter is the nominal current of the electric circuit that needs to be protected, which is also decisive for the cross section of the line.

Selective criteria: for protective devices: VDE 0100 part 430
for line cross sections: VDE 0100 part 523
Further criteria for the selection of protective devices is:
Nominal voltage, temperature, internal resistance of the fuse, inrush currents, length of lines, preimpendance of the net, possible fault location, vibration.

For additional information, please refer to
Handbuch Nr. 32 (manual no. 32)
VDE Schriftenreihe (VDE publication series)
"Bemessung und Schutz von Leitungen und Kabeln nach DIN 57100/VDE0100 Teil 430 und Teil 523"

In addition, relevant information is also available from many manufacturers of fuses and circuit breakers.

## Wiring of the Power Supply

The connections of the power supply must be routed individually from the terminal blocks in the control cabinet to the terminals corresponding to each bus station. Sensors and actuators are connected directly to the module by means of 2-wire connections. Sensors and actuators utilizing 3 - or 4-wire connections are connected through the terminal blocks that are available as optional accessories.

In- and output modules can be wired singularly as well, but a loop-through connection of the power supply is also possible. The same applies to the wiring of the terminal blocks, but special attention must be paid to the maximum applicable current in order to prevent an overload of the modules' terminals and circuit board conductors and the terminal blocks.

### 4.2.2 Earthing

## Functional Earthing

The modules must be installed on a properly earthed metallic carrier, e.g. on the rear panel of a control cabinet. The modules are installed by means of top hat rails. The rails must be earthed, with any passivation or similar treatment at the connection point to be removed. In general, this provides for sufficient functional earthing. If low interference levels are to be expected, functional earthing is also possible via the GND terminals of the power supply connections. In this case, please comply with the following: with a cable cross section of $1.5 \mathrm{~mm}^{2}$, the length of the cable between the terminal and the GND connection should not exceed 0.5 m .

### 4.2.3 Equipotential Bonding

Equipotential bonding as per DIN VDE 0100 part 540 must be provided between the system components and the power supply.

### 4.2.4 Connection of Peripherals

All peripherals, such as digital or analog sensors/actuators, that are going to be connected to the interfaces of the CL150 system must comply with the protective separation requirements of electrical circuits as well.

## Connection of Outputs

## Inductive Loads

Inductive loads, such as solenoid valves and contactors, must be provided with a suppressor circuit directly at the load. Otherwise, each interruption of the line between the output and an inductive load will result in very high interference levels that, under unfavorable circumstances, might lead to failures of this or other systems.

Especially if a switch (e.g. for safety interlocks) is provided in series with the inductive load, a suppressor circuit is absolutely necessary.

All interference suppression elements that are available in commerce can be used as fuses.

For further information, we recommend the brochure „Handbuch zur Entstörung von geschalteten Induktivitäten", by Lütze, Weinstadt, Germany.

## Output Paralleling

In order to increase output currents, parallel output connections can be used. Therefore, all corresponding output bits in the controller must be set.

## Reverse Voltage Protection

Reverse voltage protection is ensured only when no external power supply is connected.
CAUTION!
Damage to the module may be caused by the following:
Polarity switching with simultaneous short circuit of output cables.
Polarity switching with simultaneous connection of externally
polarized suppressor diodes at the output cables.
Application of an external voltage exceeding the supply voltage
$(24 \mathrm{~V})$.

## GND Continuity Protection

The 0 V reference potential of connected loads must be returned to the 0 V terminal of the CL150. A two-wire load connection must be established. If the $0 V$ reference is not returned (single-wire connection), GND continuity cannot be ensured.

If in this case the outputs are addressed, a leakage current may flow although the CL150 does not feature a OV connection.

If the outputs are not addressed (logic 0 ), a leakage current of up to 25 mA per output may flow.

If outputs are connected in parallel, the current will multiply accordingly.

## Connection of Inputs

Any main switching contacts available in commerce and any kind of 3 -wire encoder can be connected to the digital inputs for an operating voltage of 24 V . Electronic 2 -wire encoders may only be used if they feature improved qualities (refer to Specification of B~IO Inputs). Electronic 2-wire encoders which largely utilize the IEC 947-5-2 standard cannot be used at the CL150/B~IO inputs.

2-wire encoders according to the so-called NAMUR standard (NAMUR= committee for standardizations in measuring and control engineering of the chemical industry) are not suitable either.

## Coupling of In- and Outputs

Inputs and outputs can be coupled with each other. This is sometimes preferred if output states should be read back as an input parameter. The connection with an additional load is not necessary because the in- and output parameters are well adjusted to each other.

Wiring Example

Fig. 4-1 Wiring example
Connection of the push-on terminal strips:

| Bus station: | X11A: | Signal output |
| :--- | :--- | :--- |
|  | X11B: | 0 V |
|  | X21A: | 24 V sensor supply |
|  | X21B: | Signal input |
| Terminal blocks: | X91A...X92A: | freely assignable, in the example connected with 0 V |
|  | X91B...X92B: | freely assignable, in the example connected with earth |

### 4.3 Electromagnetic Compatibility

According to DIN VDE 0843, electromagnetic compatibility (EMC) is the property of an electrical system to operate satisfactorily within its electromagnetic environment and, in so doing, not to interfere unduly with this environment that also includes other facilities.

## Interferences

Possible sources of interferences are:

- self-generated interferences, e.g. by frequency converters, inductive loads, etc.
- externally generated interferences, e.g. by lightning discharges, mains fluctuations, etc.
The major transfers of interference are the following:
- Radiated interference injection
- Conducted interference injection
- Electrostatic discharges

## EMC Statute and CE Certification

The CL150 complies with the requirements of the EMC statute which is based on the EMC directives of the Council of the European communities.

This is documented by the CE certification. Upon request, a certificate of conformity can be issued.

The conformity of the CL150 by itself has been verified by EMC tests according to the following standards relevant for the CL150:

- EN 61131-2
- EN 50081-2

Nevertheless, this does not mean that electromagnetic compatibility can be guaranteed for the entire system. The responsibility for the entire system lies solely with the plant engineering supplier.

In order to ensure the electromagnetic compatibility it is absolutely necessary to comply with the additional installation instructions listed below.

Besides compliance with the EMC directive, the installation of the system or machine compound also requires compliance with the low-voltage directive, the EU declaration of conformity, and possible additional directives and/or guidelines that refer to specific types of systems.

### 4.3.1 Interference Emission

## Radiant Emittances \& Radio Interference

The CL150 complies with the EN 50081-2 generic standard which defines the limit values for interference emissions. This standard applies exclusively to usage in an industrial environment (in contrast to usage in residential areas). It is characterized by the following:

- No connection to the public mains network (low voltage).
- Availability of a separate high or medium voltage transformer.
- Operation in an industrial setting, or in close proximity to industrial supply networks.

The limit values for industrial applications are higher than for applications in a residential area. For this reason, if the equipment is intended to be used in a residential area, the user will be required to provide additional measures:

- Installation of the I/O system in a control cabinet, and/or in an enclosure providing a high screening attenuation.
- Filtering and screening measures regarding the lines.

If a system is intended to be used within a residential area (including business and commercial areas and small-industry settings), the user is required to obtain a personal operating license issued by the appropriate national authority or approval body. In Germany, this is the Bundesamt für Post und Telekommunikation (Federal Office of Post and Telecommunication) and its local branches.

### 4.3.2 EMI Resistance

Usually, the CL 150 functions correctly also in an environment with relatively strong interferences. For further improvement of the EMC properties it might be necessary to employ additional measures.

## Earthing

To facilitate the dispersion of interference potentials acting between the device and the ground reference plane, the device housing or chassis must have a low impedance connection to ground. The inductive coating of simple cables obstructs the dispersion of interference significantly, especially in the case of pulse-shaped interferences with rise times in the nanosecond range. Grounding strips have better high-frequency properties, and shall therefore be preferred.

## Screening

Electrical and magnetic interferences can be prevented by sufficient screening and spacial separation. Potentially interference-prone components (power supply and motor cables, contactors, frequency converters, etc.) must be screened or installed separately from components with lower signal-to-noise ratio (e.g. signal cables, electronic controllers). Preference shall be given to the employment of transformers featuring shielding winding because they ensure a very effective attenuation of interferences at higher voltage levels.

## Filter

Filtering measures are dependent on the relevant application and the application environment. Suitable filters can be selected from a wide range of available products.

## Twisted Pair Wiring

Twisted pair wiring of forward and return data transmission lines as well as twisted pair wiring of power supply lines can, to a great extent, prevent interferences and the development of interference fields in and/or due to these lines.

## Parallel Routing of Data Transmission Lines and Interference-Prone High-Voltage Cables

Close and parallel installation of data or input/output cables and interference-prone cables, such as motor cables and cables leading to poorly interference-suppressed contactors, must be avoided. The smaller the distance between parallel-routed cables, the higher the degree of interference. In cable channels and control cabinets, the power and data cables must be installed as distant from each other as possible, maintaining a minimum distance of 10 cm ; installation in separate, screened compartments is preferred. Data cables shall cross power cables at an angle of $90^{\circ}$.

## Protection Against Electrostatic Discharges ESD

The CL150 contains components which may be destroyed by electrostatic discharges (ESD). A defect of the module caused by such discharges is not necessarily be noticeable immediately, but may also manifest itself in the form of occasional or delayed failures. It is therefore absolutely necessary to comply with the relevant measures regarding the handling of electronic components and modules. In particular, hot insertion and unplugging of connectors is not permitted.

## Interference Suppression of Inductive Loads

The outputs of the CL150 utilize built-in DC clamp diodes to keep inductive switching peaks at a safe level. However, the occurrence of a cable break, the removal of a plug from the inductive load (e.g. solenoid valves, contactors, etc.) or the deliberate deenergizing through a mechanical contact causes very high interference voltages which can spread out throughout the system via electrical, inductive and capacitive coupling. To attenuate these interferences, the inductive load must be connected to an appropriate interference suppression device (freewheeling diode, varistor, or resistance-capacitance circuit). Due to their universal applicability, the use of bi-directional suppressor diodes is recommended. These consist either of a pair of reverse-polarity, seriesconnected suppressor diodes or of a single polarized suppressor diode with bridge rectifier. Ready-to-use modules of this type are readily available in commerce. Another suitable means of interference suppression are varistor modules. Manufacturers of contactors e.g., sell, in addition to their contactors, such matching varistors.

## Precautions against Transient Overvoltages (Surge)

All power supply units of the controller must be connected with external varistor modules (e.g. Phoenix MODUTRAB VAR/3S-24AC). All digital inand outputs that should be protected must be connected to surge suppressor terminals (e.g. Phoenix TERMITRAB SLKK 5/24DC, TERMITRAB UK5/24V or the corresponding modules of the MODUTRAB series). Of course, protective modules of other manufacturers are also suitable.

## Quality of the Supply Voltage

To ensure uninterrupted operation, the logic circuit power supply of the CL150 is capable of bridging voltage dips of up to 10 ms . This makes an interruption of the bus operation due to brief voltage dips highly unlikely. No voltage bridging is available for outputs. Accordingly, brief voltage dips may cause contactors and other actuators to drop off. In normal circumstances, the falsification of input data due to voltage dips is already prevented by filters in the input circuits. The normal response time lies at about 3 milliseconds. In the event that interruptions of greater duration occur, the introduction of suitable measures will be required. For example, magnetic IR drop compensators can be employed on the AC side, or backup batteries and/or backup capacitors on the DC side.

## 5 Programming

Programmable logic controllers process a program in which the controller task is described. To do so, a special programming language is used which may be displayed and printed out in various methods of representation.

The CL150 is programmed with an AT-compatible PC and the WinSPS utility programming package for Windows $N T^{\circledR}$ or Windows $95^{\circledR}$. Version 2.40 and higher are suitable.

The program can be edited OFFLINE, i.e. without connection to the controller.

## Loading Program

## Program Startup

## Program Documentation

For program startup, please use the monitor function of WinSPS.
A detailed display of the current control state, program tracking, operands display, fixation and other useful „online" functions make a quick startup of the PLC program possible and help the user with the elimination of interferences in a system.

WinSPS makes it also possible to create a clear and easily understandable PLC program documentation with reference lists and many comments either on the monitor of the programming unit or as a printout.

### 5.1 Types of Representation

## Instructions List (IL)

Structure of controller instructions

| Controller Instructions |  |  |
| :--- | :--- | :--- |
| Operation part | Operand attribute | Source <br> operand |
| OPP | OPA <br> SRC <br> Operanation <br> operand |  |
| ORST |  |  |

## Example:

| A | B | I0.0 |  |
| :--- | :--- | :--- | :--- | :--- |
| A | W | - Name | A |
| L | BY | OO | B |
| T | W | C | M10 |
| MUL | W | 1234 | D |

## Ladder Diagram LD

## Function Diagram (FUD)

When using the LD representation method, the controller tasks are described by means of standard circuit diagram symbols.

## Sequential Function Chart (SFC)

When using the FUD representation method, a graphical symbol display illustrates the logical links.

The SFC represents a graphical programming interface which is used to describe those machine tasks that are to be processed sequentially in the form of a cascade sequence. Before it can be loaded into the PLC, this representation is translated into the executable IL programming language.

### 5.2 Program Structure

To create a clear PLC program structure which is easy to read, Bosch consistently employs structured programming for its programmable logic controllers. This way, the programs can be divided into functionally interconnected program segments. To support this clear structuring, several module types performing various special functions are available.

### 5.2.1 Module Types

The controllers utilize the following module types:

- Organization modules
- Program modules
- Data modules

All modules are enabled by being called up or activated in the program. This may be done either unconditionally or conditionally. Such a condition might be the result of a logic operation or a compare function or an arithmetical operation.

## Organization Modules (OM)

The organization modules perform all administrative functions of the controller program. They are programmed in the same way as the program modules, but called up by the system program only. The PLC's entire command set is available in the organization modules. There is no limitation to module size.

The organization modules can be divided into 7 functional groups:
OM1 Module which is cyclically called by the system program and which may be utilized as a distribution module for the entire program. At the end of the OM1, the input-output cycle is always processed, regardless of whether it is closed with program end EP or with module end EM.

OM2 Non-executable definition module (initialization table) in which specifications (remanence limits, etc.) for the controller system are defined by modifying entries.

OM3 Non-executable definition module (initialization table) in which the configuration of the $\mathrm{B} \sim 1 \mathrm{O}$ modules can be set. The module is automatically generated by WinSPS's „IO Configuration" function and, if desired, just needs to be linked to the program (entry in the symbol file).

OM5, OM7 Startup modules for processing a variety of program sequences during a restart of the controller.

OM9 Error module which processes responses to program errors.

OM10- OM12 Interrupt modules for immediate responses to peripheral events.

OM17 Interrupt module which processes responses during the operation of the 1 ms timer.

OM18+OM19 Time-controlled processing, time matrix definable in OM2.

## Program Modules (FC)

The program modules (FC) contain program segments that are technically and functionally interrelated. Within program modules, any number of additional program modules and data modules may be called up. In addition, the entire command set of the PLC is available in all program modules. The modules are not subject to a size limit.

Program modules are usually concluded with an End of Module (EM) instruction. If the End of Program (EP) instruction is used, the program will be aborted immediately after the instruction has been processed, and the input/output cycle will be activated. Further program processing then recommences with the OM1 organization module.

Due to the option of parameterization, the program modules may be written independently of absolute operands. During the module call-up, the operands required for the current processing task are transferred to the program module in the form of parameter values.

The following input and output parameters may be specified:

- Input parameters: operands, constants and modules
- Output parameters: operands

## Data Modules (DM)

The data modules (DM) serve as storage areas for all fixed and variable values and text blocks that are used by the program. This way, it is always possible to keep two data modules enabled during PLC program processing, each of which provides up to 512 bytes of memory capacity.

The following applies to the processing of data modules:

- Before their respective data may be accessed, the data modules must be enabled in the program by means of module call instructions (i.e., CM for the 1st DM, and CX for the 2nd DM).
- Within a given organization module (OM) or program module (FC), the data modules remain valid until other data modules are enabled by the program.
- After the return to the primary module, those data modules which were active at the time of the call-up of the base module are again activated.
- When the OM1 (cyclical program processing) and the startup modules OM5 and OM7 are called, no data module is active.

### 5.2.2 Exemplary Application Program Structure

With the aim of providing a clear overview of the basic organization of program management, the following diagram shows an example of the program structure

Program start-up, one-time only
OM5 / OM7
Program
EM

## Time-Controlled Program Processing

Processing always commences subsequent to the change of module (not data module call) that follows the expiry of the associated time interval.

OM18-OM19

```
Program
```

EM

## Interrupt-Controlled Program Processing

Processing always commences immediately upon appearance of the triggering criterion.

| OM10-OM12, OM17 |
| :--- |
| Program <br> EM |
| The trigger for OM17 is the end of the 1ms timer. |

## Program Processing Subsequent to PGM Error

Processing always commences immediately upon appearance of the triggering criterion.

### 5.3 Reference List

In the program memory, three data words per module are reserved for the reference list.

They contain:

- Number of the memory segment where the module is located. The RAM of the application program has the segment number 1 , the extended memory carries the segment number A; also refer to 5.4.1 Program Memory.
- Address offset of first instruction, and/or of first data word in the module, relative to the initial address of the segment.
- Size of module in byte without module header.

Each of the modules available in the CL150 is characterized by these entries.

The reference list can be displayed on the WinSPS monitor.
This provides you with a detailed and clear overview of the structure of the application program memory and, in particular, of the allocation of a module to the application program's RAM and the extended memory.

### 5.4 Memory Structure

In order to store the application program and the user data, the CL150 provides various memory areas.

Types of Memory

### 5.4.1 Program Memory

## User Program RAM

## Basically, there are 2 types of memory:

- A Random Access Memory (RAM) which, with the use of a battery, is backed up if the power supply of the controller is switched off or fails.
- A flash memory for non-volatile data storage, also working without backup battery.

The operating system of the controller is located in the flash memory.

The application program which consists of the reference list, the organization modules (OMs), the program modules FCs and the data modules DMs is generally processed out of the RAM area. To do so, a RAM of 64 kbyte is available.

## Backup Memory

To prevent that, in case of operation without a backup battery, the application program is not lost when the power supply is switched off, a copy of the program's RAM is loaded into another FLASH segment, the backup memory, when the program is loaded from the programming unit into the controller.

This backup function is activated only with „Load total program".
Program modifications that are due to the "reload module" functions and modifications to the data modules' contents that are due to the application program have an impact on the RAM of the application program only, not on the backup memory.

Program modifications that are due to „reload module and „Replace" are processed in the WinSPS monitor. In this case, it is possible to update the backup memory when leaving the monitor program. If an update takes place, be aware that the current contents of the data modules are copied as well and the initialization values are overwritten.

## Extended Memory

It is possible to extend the application program by 64 kbyte . To do so, the OMs, FCs and DMs can be given the identifier „E" instead of „R" for declaration in the symbol file. For these modules, the flash memory has reserved a segment of 64 kbyte (extended memory).

The reference list, however, is always stored in the RAM of the application program.

This way, the application program can always comprise a total of 128 kbyte.

The extended memory has no correlation with the backup memory.
$\Rightarrow$ The following applies to the extended memory:

- Monitor operation is not possible in the extended memory.
- Only tested and functioning modules should be swapped out into the extended memory.
- Data modules in the extended memory cannot be described by the application program. They are only suitable for data that remain constant while the controller is running (e.g. recipes, constant machine parameters, etc.).
- The extended memory is described only with „Load total program". The function „Reload single module" is not possible.

Fig. 5-1 Program Memory Structure

### 5.4.2 Data Memory

Except for the data modules (see above), all data modules are stored in the RAM areas.

- Image for inputs and outputs
- Actual values and states of times and counters
- Markers
- System area data
- Data field

If a backup battery is used, it is possible to keep this data remanent even if the power supply is switched off or fails.

### 5.4.3 Flash Memory

In addition to and independent of the above mentioned memory areas, two more FLASH segments are reserved solely for keeping the current status of the program RAM and the current status of the user data temporarily non-volatile. This data backup as well as reloading the data is only possible via the Store and Recall functions, by operating the switch/button at the controller, also refer to 3.3 Switches and Buttons.

This function is mainly used to prevent the loss of data during a battery exchange with the supply voltage being switched off.

Please proceed as follows:

* Switch CL150 to Stop.
* Press the button S2 Copy/Battery once; this will take the controller into the Store mode for about 5 s ; the MODE LED is yellow.
* In Store mode: turn the S1 toggle switch to Run. The current data is copied from the RAM into the flash memory. During the copying process the MODE LED blinks yellow/green. Afterwards it returns to red, indicating the initial state. Now the data is non-volatile.
* Turn the S1 switch back to Stop.
* Switch off the supply voltage.
* Change the battery as described in 3.4 Backup Battery
* Switch on the 24 V supply voltage.
* Press the button S2 Copy/Battery two times; this will take the controller into the Recall mode for about 5 s ; the MODE LED blinks yellow.
* In Recall mode: turn the S1 switch to Run. The data stored in the flash memory is loaded back into the RAM data areas. During the copying process the MODE LED blinks yellow/green. Afterwards it returns to red, indicating its initial state.
* Turn S1 back to Stop.

The next time the Run function is switched on, the controller starts with the current data module contents and with the set data remanence; also refer to 6.5.1 Remanent Startup.
$\Rightarrow \quad$ After the Recall function, the contents of the backup memory are
automatically cancelled.
$\Rightarrow \quad$ When the flash memory is empty, i.e. if no program status has been stored into the flash memory, the Recall function automatically goes back to the backup memory and the basic status of the application program is loaded (after „Load total program") together with the initialization values of the data modules. Program modifications that have been previously applied with „Reload module" and that have not yet been updated in the backup memory, are lost for the controller.

Backup of the Real Time Clock
The current real time is backed up by the Store function as well.
If the 24 V supply is switched off and the backup battery is removed, the contents of the clock module is lost.

By means of the Recall function, the old time and date are reloaded into the clock module. The clock then continues to run but of course with the inaccuracy caused by the interruption.

Is the inaccuracy critical for the application, the clock must be reset by means of the programming unit.

## 6 Operating Characteristics

### 6.1 Operating Modes

The CL150 recognizes the operating modes „Operation with Battery" and "Operation without Battery". They can be selected by setting the initialization flag DW02, Bit 7 in OM2; also refer to 6.3 Initialization Module OM2.

- DW0, Bit $7=0 \quad$ Operation without battery
- DW0, Bit 7 = $1 \quad$ Operation with battery

Ex works, the OM2 is set to „Operation without Battery".
The set operating mode is displayed in the Infostatus of WinSPS.

### 6.1.1 Operation without Battery

If the CL150 is operated without a battery, the "Operation without Battery" operating mode must be set in the OM2.

After starting the controller, the RAM of the application program and the data memory remain, for the time being, in an undefined state.

The operating system automatically copies the application program from the backup memory into the RAM of the application program. The data modules then contain the initialization values, contents after „Load total program".

The operating system cancels the user data as defined and sets the real time clock to the value 01.01.00 / 00:00; the day of the week remains undefined. A remanent startup is not possible.

In the Run state, the controller starts without generating a battery failure message or a low battery warning.

### 6.1.2 Operation with Battery

If the CL150 is operated with a battery, all RAM and real time clock contents remain if the 24 V supply is switched off.

After switching on the 24 V supply, the controller immediately processes the application program currently located in the application program's RAM together with those data module contents that have been valid prior to the 24 V supply's switch-off. The operating system is able to run a remanent startup according to the settings in the OM2.

#### Abstract

DANGER! Danger to persons and equipment! If the CL150 is supposed to work in the operating mode "Operation with Battery", the same has to be definitely set in the OM2. Only then can be guaranteed that, in case of a battery failure, a battery failure message or a low battery warning is sent out and an unpermissible startup of the controller is prevented.

## Battery Test and Battery Failure

When the controller is switched on, the proper state of the battery backup is checked. If the battery backup does not work correctly and the battery operation is set, a battery failure message is given out. The controller remains in Stop. The blinking of the green operation LED and the lit, red status LED indicate the battery failure which is also reported in the Infostatus.

## Reset Battery Failure

## Battery Load Test

After a battery failure, only a completely non-remanent startup is possible. The program must be regenerated or newly loaded by means of the programming unit. This way, the battery failure is automatically reset.

Regenerating the program can be done with the Recall function out of the flash memory or the backup memory; also refer to 5.4 Memory Structure.

When the flash memory is empty, i.e. if no program status has been stored into the flash memory by using the Store function, the Recall function automatically goes back to the backup memory and the basic status of the application program is loaded (after „Load total program") together with the initialization values of the data modules. Program modifications that have been previously applied with „Reload module" and that have not yet been updated in the backup memory are lost for the controller

The battery load test does not only check if the battery is present but it also checks the battery state by measuring the current with a defined battery load.

The battery load test is automatically performed when the controller is switched on. During operation the user can trigger the battery load test by doing the following:

- By pressing the copy button in Run

The test is performed once during the following I/O state.

- By pressing the copy button in Stop

The test is performed once and immediately.
Pressing the copy button is acknowledged by the yellow light of the MODE LED, which lasts for about 5 s .

- In the application program, the battery load test is triggered by setting the control bit S2.0 in the system area. The test is automatically performed once in the following I/O state and the control bit is automatically reset.
$\Rightarrow$ When a battery load test is performed, current is temporarily taken from the battery. Due to the frequency of the tests, the service life can be reduced. It is therefore recommended to provide the triggering of the battery load out of the application program with a time control mechanism, e.g. the real time clock.

## Low Battery Warning

In case of a weak or non existing battery the battery load test activates the Low Battery Warning.

This means that with the next 24 V power supply switch-off, the retention of the data cannot be guaranteed.

The Low Battery Warning does not cause the controller to stop.
It is signaled

- by blinking of the green operation LED
- in the Infostatus
- by setting the status bit S30.7 in the system area, which makes the warning available for a program-related evaluation.

### 6.2 Operational States

### 6.2.1 Stop

In the operational status Stop, the controller does not process any application program.

- All outputs are reset.
- The MODE-LED is red.
- The cause for the stop is indicated at the programming unit, WinSPS/Infostatus.

## Causes for Stops

There are several causes for the Stop state:

- Stop caused by switch

Toggle switch S1 in up position

- Stop caused by programming unit In WinSPS, the operational state of the controller can be switched.
- Stop through one of the integrated inputs

In the dataword 37 of the OM2, one of the integrated inputs of the CL150 can be selected as a Stop input. Through this input, the controller can be switched to the Stop state from a peripheral device or with an externally installed switch. This function must be additionally released by an initialization flag, Bit 6 in dataword 2 , in the OM2.

- Stop through busmaster

Versions with a fieldbus connection can also be switched into the Stop state over the bus master.

- Stop because of application error

Programming errors that can only be detected when the program is already running generally lead to the stop of the controller. A list of all possible errors is included in the description of the system area; also refer to 7.7 System Area. Here, each of the errors has been assigned a bit that is set when the corresponding error occurs.

- HLT command

By means of the HLT command, the controller can be switched to Stop out of the application program.

### 6.2.2 Run

The controller automatically goes into Run if there is no cause for a Stop.
The program and the I/O state are executed.
The MODE LED is green.

### 6.2.3 Special States

## Disable Outputs

All digital outputs as a whole can be disabled with the WinSPS/Monitor programming unit.

The controller operates the same way as if in Run, but all digital outputs to the peripherals are reset. The output image is occupied with the current values.

The MODE LED blinks green.

## Fixing

Outputs, inputs and markers can be fixed permanently to certain bit states and/or values with the WinSPS/monitor programming unit.

In operation with battery the fixation is remanent.
The MODE LED blinks green.

## System Errors

If the operating system detects a system error, the MODE LED blinks red. In general, a service code is given out in the Infostatus, which is very helpful during error analysis.

If, in connection with the Store or Recall function, an error occurs during copying, the MODE LED blinks red/yellow. The function must be repeated.

### 6.3 Initialization Module OM2

The OM2 is a system initialization table that is linked to the PLC program.
The following is set in the OM2:

- Monitoring functions
- Remanence limits
- Time OMs
- Onboard counter and onboard analog I/O
- Peripheral assignments

With Power On and Stop/Run, the settings in OM2 are taken over by the system and partly copied into the system area even before a possible Startup-OM is processed.

All kinds of influences on the system initialization are shown in the following OM2 printout.

;DW 4: Maximum cycle time (entries permitted)

### 6.4 Startup Characteristics

### 6.4.1 System Startup

Fig. 6-1 System Startup

### 6.4.2 PLC Program Startup

Fig. 6-2 PLC Program Startup

### 6.5 Remanence Characteristics

Unless other limits are specified within the OM2, the remanence characteristics of the CL200 are subject to the range limits described below. These limits cannot be changed by means of the PLC program.

### 6.5.1 Remanent Startup

In remanent operation, the statuses of the operands designated as remanent are retained after a Stop/Run and Power-On/Off mode change. As a precondition, the operating mode must be set to „Operation with battery" and there must not have been detected any battery fault.

In the absence of specific designations in the OM2, the following areas are remanent:

- The upper half of the marker range, M76 to M152
- The upper half of the counters, C32 to C63
- The upper half of the times, T64 to T127

The operands which are set to be non-remanent are deleted, irrespective of the operating mode.

The entire data field, the data modules and the fixation are always remanent. They are deleted only upon fixations following a programming unit request.

### 6.5.2 Non-Remanent Startup

The non-remanent operation is set by shifting the remanence limits in the OM2 to the highest possible address.

In the operating mode "Operation without Battery" only a non-remanent startup is possible after switching on the 24 V supply.

### 6.6 Fixation

The CL150 offers the option of fixing the operands by means of the programming unit.

This way, operands can be permanently set to specific bit statuses and/or values, in contrast to the "Control" function of the programming unit.

The following data areas in the CL150 are fixable:

- Inputs
- Outputs
- Markers

Remanence of Fixation
An established fixation remains enabled under the following conditions:

- After a Stop/Run operational status change
- In operation with battery after power on/off.

### 6.7 Watchdog and Cycle Time

## HW Watchdog

The processor function of the CL150 is monitored by a hardware watchdog, typical watchdog time: 1.6 s .

Fault response

- The CPU is brought into a defined status with Reset and signals HW error.
- An error code is given out in Infostatus.

## Cycle Time Monitoring

The CL150 monitors the cycle time with regard to the maximum value of about 1 s . A second cycle time barrier in the OM2 can be determined below this value. During operation, this barrier cannot be modified anymore by the program. The cycle time is always measured from OM1 to OM1 and contains therefore the time of the I/O state as well.

## Fault response

- Cycle time error message in Infostatus
- OM9 call, then Stop
- or, if the OM9 is not linked, immediate Stop status.

## Switching Off Cycle Time Monitoring

Cycle time monitoring can be switched off in the OM2 for the time of the starting modules. This way, very long starting routines and the initialization of peripheral modules do not lead to the controller's Stop.

## DANGER!

Danger to persons and equipment!
In the case of peripheral operations with the hardware watchdog disabled, faulty programming (endless loops) may create dangerous system conditions!

### 6.8 Error Characteristics

The controller's operating system performs several monitoring functions during the startup and execution of the program.

## System Errors

Serious system errors like defective modules, are detected right after switching on the supply voltage. The controller does not start. The error is signaled by the red flashing MODE LED and generally requires repair work on the modules by BOSCH's service personnel.

A system error can also be generated during operation if a defect of a module triggers the hardware watchdog.

Depending on the cause of the error, a service code can be displayed in the Infostatus which facilitates the analysis and the elimination of the error essentially.

## Battery Failure

When the 24 V supply is switched on and a data loss occurs in the RAM, the CL150 remains in Stop and indicates a battery failure if the operating mode "Operation with Battery" is set in OM2. The UL LED blinks green and the MODE LED is red.

The battery failure is displayed in the Infostatus.
The error is eliminated by replacing the non-functional battery with a new one. The program can be restored with a new start or with the Recall function.

## Configuration Error

If the desired configuration of the $\mathrm{B} \sim 10$ modules is preset by linking the OM3, it will always be compared to the actual configuration taken up with the 24 V supply when the system is started.

Differences are displayed in the Infostatus as „Conflict in module configuration diagram" and the controller remains in Stop.

The error is eliminated by adjusting the desired and the actual configuration.

The configuration monitoring can only be switched off by removing the OM3 from the symbol file, which will lead to an automatic configuration and address assignment; also refer to 3.1.6 Connection of B~IO Modules, Addressing of Modules.

The following error messages are triggered by errors in the PLC program.
They inevitably lead to the stop of the controller.
If the OM9 error module is linked to the application program, it is processed before the status changes from Run to Stop. The cause of the error is displayed in the error words of the system area. This way, a program reaction to the relevant error is possible before the controller goes into Stop.

- Addressing error
- Parameter error
- Module stack overflow
- DM too small
- Error "Jump direct"
- Illegal write-access
- Opcode error
- Timer no. too large
- DM not active
- Nonexistent module called
- Under-/Overflow of the application stack
- Cycle time error

The error is signaled in the Infostatus of the programming unit.
By using the monitor function "Go to", the error in the PLC program can be localized very quickly.

## 7 Program Execution

### 7.1 List of Modules

The CL150 manages the following modules:

- 12 organization modules
- 128 program modules
- 128 data modules

| Name | Function | Comment |
| :--- | :--- | :--- |
| OM1 | Cyclical program execution |  |
| OM2 | Initialization table | refer to 6.3 Initialization Module OM2 |
| OM3 | Configuration table | I/O configuration; also refer to 3.1.6 Connection of <br> B~IO Modules, Addressing of Modules |
| OM5 | Startup module after Power-ON |  |
| OM7 | Startup module after Stop/Run |  |
| OM9 | Error module | e.g. cycle time error |
| OM10 | Interrupt module | assigned interrupt I0, priority 1 |
| OM11 | Interrupt module | assigned interrupt I1, priority 2 |
| OM12 | Interrupt module | assigned interrupt I2, priority 3 |
| OM17 | Interrupt module 1ms timer | 1ms time matrix |
| OM18 | Time-controlled module | matrix definition in OM2 or S10, priority 1 |
| OM19 | Time-controlled module | matrix definition in OM2 or S12, priority 2 |
| FC0-FC127 | Program modules |  |
| DM0-DM127 | Data modules |  |

### 7.2 Operand \& Module Identifiers

| Abbr. | Operand | Peripheral Access/ Data Width | Image Update |
| :---: | :---: | :---: | :---: |
| 1 | Input with image | Image/ bit, byte, word | in I/O state |
| II | Interface inputs ${ }^{1}$, physically equal to I | direct/ byte, word | with program processing |
| 0 | Output | Image/ bit, byte, word | in I/O state |
| 10 | Interface outputs ${ }^{2}$, physically equal to O | direct/ byte, word | with program processing |
| M | Marker |  |  |
| T | Time (Timer) |  |  |
| C | Counter |  |  |
| $\begin{aligned} & \hline \mathrm{D} \\ & \mathrm{DX} \end{aligned}$ | Data word, 1. act. DM Data word, 2. act. DM |  |  |
| DF | Data field |  |  |
| OC | Onboard counter |  |  |
| S | System area |  |  |
| K | Constant | Call 1. active DM Call 2. active DM |  |
| DM | Data module |  |  |
| FC | Program module |  |  |

[^0]
### 7.3 Startup Modules OM5 and OM7

Two startup modules are available: OM5 and OM7. If a startup module is linked to the PLC program, it will automatically be processed when the controller is started.

- OM5: Startup module for new start, is always processed after Power-On. This is also applicable if the CL150 is in Stop after Power-On. In this case the OM5 is processed when the operational status switches from Stop to Run. The OM5 is also processed after Program-Loading.
- OM7: Startup module for restart, is processed after the operational status has changed from Stop to Run provided that it is not a first startup after Power-On.

The entire instruction set can be used in the startup modules.
As a close instruction for the startup modules, both the EM and the EP instruction can be used. Both have the same effect on the module.

In the event that program modules are called during the processing of startup OMs, the close instructions of such program modules will have the established meaning:

- EM: Return to the calling startup OM
- EP: Cancel, continue with OM1

### 7.4 Cyclical Program Processing

The operating system cyclically calls the OM1 organization module.
Prior to each call, the I/O image of the CL150 is updated.
The OM1 primarily serves for program controlling. It starts the bottom level of the program modules.

The OM1 must be linked to each PLC program once.

### 7.5 Interrupt-Controlled Program Processing

The CL150 recognizes several groups of interrupts:

| TI | Program interruption through time-controlled OM |
| :--- | :--- |
| PI | Program interruption through peripheral event, interrupt inputs |

When an interrupt occurs, the normal program flow is interrupted and the corresponding organization module is activated.

The group of time interrupts has the lowest priority, the group of peripheral interrupts the highest. Within the groups, the interrupt that has been assigned the lowest OM number is the one with the highest priority.

The 1 ms timer interrupt OM17 is special. Even though it is a time interrupt by nature its mode of functioning corresponds to a peripheral interrupt.

### 7.5.1 Time-Controlled Program Processing OM18/OM19

The time OM is called up

- 1. when the established time has elapsed and
- 2. after a module change.

Neither a DM call nor an EP instruction is considered a change of module.
The time interrupts are always enabled by standard. Interrupt disabling and enabling are controlled by interrupt mask programming.
$\Rightarrow$ Due to programmed module nesting within time OMs, additional time OMs can appear and be processed, with the understanding that active time modules are incapable of causing their own interruption.

### 7.5.2 Event-Controlled Program Processing OM10/OM11/OM12

In addition to their standard function, the inputs $10.0,10.1$, and 10.2 can also be used as interrupt inputs, peripheral interrupts.

A peripheral interrupt is triggered by a $0 \rightarrow 1$ (LOW $\rightarrow$ HIGH) signal change at the associated input. The processing is not linked to a module change. Instead, it branches into the respective interrupt OM immediately after processing the current instruction in the PLC program.

In this process, the flag register, i.e. RES, etc. and the system register contents are rescued.

The user is responsible for effecting possibly necessary rescues of registers, scratch markers, etc.

The peripheral interrupts are always disabled by default. Interrupt disabling and enabling are controlled by interrupt mask programming.
$\Rightarrow \quad$ Active peripheral interrupts are neither capable of interrupting themselves, nor can they be interrupted by time interrupts.

### 7.5.3 1ms Timer Interrupt OM17

The interrupt is triggered by the processing of the hardware timer with 1 ms matrix.

The time OM17 is called up when the established time has elapsed and the processing of the current instruction is finished.

The 1 ms timer interrupt has the highest priority of all interrupts. The interrupt OM17 can neither be interrupted by peripheral interrupts nor by time interrupts.

The 1 ms timer interrupt works like a peripheral interrupt.
With regard to administration though (interrupt register, interrupt mask, interrupt command), the 1 ms timer interrupt has been assigned to the group of time interrupts.

### 7.5.4 Instructions for Interrupt Handling

An interrupt mask has been assigned to each interrupt group, time interrupts ( TI ) and peripheral interrupts ( PI ). The TIM and LIM instructions are used to read from and write to these masks.

Within an interrupt group, each interrupt is provided with a bit in the corresponding mask.

If such a bit is set, it means that the respective interrupt is enabled. If such a bit is not set, it means that the respective interrupt is disabled.

In order to actually enable the interrupts assigned in the mask, the additional EAI (Enable All Interrupts) instruction is required!

In order to generally disable an interrupt group without influencing the mask entries, the DAI (Disable All Interrupts) instruction is required.

Incoming interrupts cause an entry in the corresponding interrupt register even though the corresponding interrupts are masked. Again, a bit has been assigned to each interrupt.

If the interrupt is executable, i.e., enabled, the bit in the interrupt register will be automatically canceled by the call-up of the interrupt OM.

If the interrupt is disabled, the bit will remain in the interrupt register while the interrupt is waiting to be enabled.

The interrupt register can be read with the LAI (Load All Interrupts) instruction and waiting interrupts can be canceled with the RAI (Reset All Interrupts) instruction.

With a Stop/Run change of the operating mode and with Power-Off/On, all waiting interrupts are canceled.

During startup, i.e. during the processing of OM5 and OM7, all interrupts are disabled.

The peripheral interrupts remain disabled and the corresponding mask bits are reset. Required interrupts must be enabled by the user with the TIM and the EAI instruction.

Time interrupts in the program cycle are enabled by default. They can be disabled with DAI/TI in general or by resetting the corresponding mask bits.

### 7.6 Error Module OM9

OM9 is the error module. If the module is linked to the PLC program, any error occurrences which normally cause an immediate stop of the central processing unit, will result in an automatic OM9 call.

After the processing of the OM9, the CL150 goes into Stop.
Exception:
If an upper cycle time limit has not been set and the hardware-dependent cycle time limit is reached due to a programming error, the CL150 will automatically enter Stop mode. In this case, enabling an error OM will no longer be possible.

The error module can be programmed with remedial measures to be launched in the event that an error occurs. For example, data and, possibly, error bits in the system area can be copied to non-volatile memory areas.

Retriggering program processing with error acknowledgement is excluded. After the OM9 has been processed, the CL150 always goes into Stop, regardless whether the EM or the EP instruction was used as the close instruction for the module.

### 7.7 System Area

The CL150 features a system area encompassing 128 words (S0 through S255).

The system area is the location of the CL 150's control parameters and status messages which can be processed while the system is running.

Part of the specifications defined in the OM2 are copied into the system area where they can be read by the PLC program.

If useful, system declarations can also be changed while the system is running. This includes the time intervals of the time-controlled organization modules and the system clock.

System Area Assignments

| Address | Contents | Comment |
| :--- | :--- | :--- |
| S0 / S1 | lnitialization flags like OM2_DW2 | read only |
| S2 | S26.0, execute battery load test in the following I/O state | read and write |
| S3 | Reserved for command flags |  |
| S4 - S9 | Reserved | read and write; this way, time values |
| S10 / S11 | Time value for time-controlled processing OM18 | can also be changed via PLC |
| program |  |  |

### 7.8 Setting of Time

The real time clock can be set either with the programming unit or in the PLC program.

Handling
The system clock is set by writing into the S128-S134 system area, whereby the writing must be done in a transition-controlled (pulse) way. Otherwise, the time will be reset in each PLC program cycle.
$\Rightarrow \quad$ In the event that, when setting the system clock, the respective permitted value range is exceeded, the existing clock settings will remain unchanged.

Value ranges:

- Minutes 0-59
- Seconds 0-59
- Day 1-31
- Hours 0-23
- Year 0-99
- Month 1-12
- Weekday 0-6 0=Sunday .. 6=Saturday

With the following I/O state, the operating system takes over the new time settings.

## Program Example: Setting the Clock

| ;Version: | In the following, the designation CL150 represents the name |
| :---: | :---: |
| ; | of a fieldbus version of the CL150, e.g. B~IO CL150-DP. |
| ; | The process is the same with |
| ; | any other fieldbus version. |
| ; Process: | The fieldbus master has transferred the time to be set |
| ; | into the switching matrix and, by setting a flag in the |
| ; | switching matrix, requests the CL150 to take this time over into the |
| ; | real time clock immediately. |
| ; | The CL150 acknowledges the acceptance of the time by setting |
| ; | an acknowledgement flag in the switching matrix upon which the |
| ; | fieldbus master resets the request to set the time. |
| ;Switching Matrix | The switching matrix start address is entered into the dataword 38 |
| ; | of the OM2. |
| ; | If the default entry is not altered: |
| ; | DW38: DEFW W 0 |
| ; | the data field area DF0 - DF127 is reserved as the switching matrix |
| ; | for the fieldbus communication. |
| ; | The following is defined: |
| ; | Data direction Master -> CL150: DF0 - DF63 |
| ; | Data direction CL150 -> Master: DF64 - DF127 |
| ; Time Entry: | DF2 = Seconds |
| ; | DF3 = Minutes |
| ; | DF4 = Hours |
| ; | DF5 = Day |
| ; | DF6 = Month |
| ; | DF7 = Year |
| ; | DF8 = Weekday |
| ; Request Flag: | DF1, Bit0 |
| ;Acknowledgement Flag: | DF65, Bit0 |
| ; Preconditions: | 0->1 - Transfer from DF1, Bit0 |
| ;Edge Detection: | For edge detection, the value of the acknowledgement flag |
| ; | is used, which is, in the sense of a handshake, corrected to |
| ; | the value of the request flag. If the value of the acknowledgement flag |
| ; | is 0 and the value of the request flag is 1, a rising edge |
| ; | is preseent and the precondition is fulfilled. |

Program Instructions:
L B DF1,A
;Verifiy conditions:

### 7.9 Application Stack

The application stack (AST) comprises a pushdown-pop-up memory stack with a storage depth of 128 words, using FILO (first-in-last-out) processing.

The PUSH and POP instructions make word-by-word data transfer between the registers and the contents of the application stack possible.

Example:

| PUSH W A | ; Shift contents of register A to application stack |  |
| :--- | :--- | :--- |
| PUSH W | B | ; Shift contents of register B to application stack |
| PUSH W | C | ; Shift contents of register C to application stack |
| PUSH W | D | ; Shift contents of register D to application stack |
| POP W |  |  |
| POP W | C Shift contents of application stack to register D |  |
| POP W | B | ; Shift contents of application stack to register C |
| POP W | A | ; Shift contents of application stack to register B |

In the event of an application stack underflow, bit S 28.4 will be set in the system area. In the event of an application stack overflow, bit S28.5 will be set in the system area.

Both application stack (AST) underflow and overflow conditions will cause the Stop state.

The application stack is deleted after each EP!

### 7.10 Addressing in the CL150

### 7.10.1 Register Structure

The CL150 features 4 working registers which can be addressed in a bitwise, byte-wise or word-by-word fashion. In this context, it should be noted that byte/word addressing always addresses the low-byte word

|  | 1587 |  |
| :---: | :---: | :---: |
| Working registers | High byte | Low byte |
| A, B, C and D | Word |  |

With operations that exceed the 16bit format, permanent register pairs are created from the registers.

|  | 8 |
| :---: | :---: |
| Working register pair | Word 2 = Low word B |
| A + B | Word 1 = Low word A |

|  | 15 | $8 \quad 7$ |
| :--- | :---: | :---: |
| Working register pair | Word 2 = Low word D |  |
| C + D | Word 1 = Low word C |  |
|  |  |  |

## Status bits

The negative flag always corresponds to the MSB (most significant bit) of the specified data format. I.e. that for byte operations, it is Bit 7, and for word operations, it is Bit 15.

### 7.10.2 Data Formats

This addressing mode differentiates between load and transfer instructions.

## Load Instructions

The source operand may be either the even-numbered LOW byte or the odd-numbered HIGH byte.

In the case of the destination operand (register), the LOW byte is always addressed.

Examples: L B M1,A

## Transfer Instruction

In the source operand (register), the LOW byte is addressed. The destination operand may be either the even-numbered LOW byte or the odd-numbered HIGH byte.

Examples: T B A,M1

T B A,M2

### 7.10.3 Representation of Constants

| Data type |  | PLC Utility Program |
| :---: | :---: | :---: |
| Explanation | Representation | WinSPS |
| UINT (unsigned integer) | binary / dual | $\begin{aligned} & \text { 2\#0000000000000000 } \\ & 2 \# 111111111111111 \end{aligned}$ |
|  | decimal, word | 00000-65535 |
|  | hexadecimal | 16\#0000-16\#FFFF |
| USINT (unsigned short <br> integer) | binary / dual | $\begin{aligned} & 2 \# 00000000 \\ & 2 \# 11111111 \\ & \hline \end{aligned}$ |
|  | decimal, byte | 000-255 |
|  | hexadecimal | 16\#00-16\#FF |
| INT (signed integer) | decimal, word | -32768-+32767 |
| Text, STRING(2) | ASCII | 'AB' |
| Time value, TVALUE | Time value <br> (+Timebase r) $\mathrm{r}: 0=10 \mathrm{~ms}, 1=100 \mathrm{~ms}$ $2=1 \mathrm{~s}, \quad 3=10 \mathrm{~s}$ | T\#10ms - T\#10230s T\#0.r - T\#1023.r |

### 7.10.4 Program Module Call

|  | PLC Utility Program WinSPS |  |
| :--- | :--- | :---: |
| Program module/Function call (IEC1131/3) | CM | CC5 |
| Data module | CM | DM4 |

### 7.10.5 Jump Instructions

|  | PLC Utility Program WinSPS |
| :--- | :--- |
| Jump instruction <br> Jump destination | JPx <br> label: |

### 7.10.6 Bit and Module Addresses

| Operand | Addresses (dec.) |  |
| :--- | :--- | :--- |
| I | $0.0-47.7$ |  |
| O | $0.0-31.7$ |  |
| II | $0.0-1.7$ | not for B~IO modules |
| IO | $0.0-0.7$ |  |
| M | $0.0-151.7$ | optionally remanent |
| T status | $0-127$ | optionally remanent |
| C status | $0-63$ | optionally remanent |
| DM | $0-127$ |  |
| FC | $0-127$ |  |

### 7.10.7 Byte Addresses

| Operand | Addresses (dec.) | Comment |
| :---: | :---: | :---: |
| 1 | 0-47 | I1 only with the CL151, CL150A and CL151A version |
| II | 0-1 | Physically identical with 10 and/or I1; 11 only with the CL151, CL150A and CL151A version |
| 0 | 0-31 |  |
| 10 | 0 | physically identical with O0 |
| Actual T value | 0-127 | Time range 10 ms -1023 s, matrix $0.01 ; 0.1 ; 1 ; 10 \mathrm{~s}$ |
| Actual C value | 0-63 | Counter range 0-8191 |
| M | 0-151 |  |
| S | 0-255 | Here, the following is administered: <br> - System initialization values <br> - Analog onboard I/O <br> - Onboard high-speed counters <br> - System clock <br> - Auxiliary bits, $\log 1 / 0, R I$, flasher, etc. |
| TST | 0-31 |  |
| DF | 0-8191 |  |
| D | 0-511 |  |
| DX | 0-511 |  |

The even-numbered byte addresses are used to address words.

### 7.10.8 Addressing Modes

## Direct Addressing

Operands for absolute addressing

| Byte/word readable | I, O, M, T, C, Constant, DF, D, DX, S, II* | for T/C, the actual values are applicable <br> * only onboard inputs |
| :--- | :--- | :--- |
| Byte/word writable | $\mathrm{O}, \mathrm{M}, \mathrm{DF}, \mathrm{D}, \mathrm{DX}, \mathrm{S}, \mathrm{IO} *$ | ${ }^{*}$ only onboard outputs |

Direct addressing of all absolute addressable operands

Examples:
L B I10,B ; Loads the status of input byte I10 into B.
L W 100,C ; Loads the decimal value 100 into Register C.

## Register - Register Addressing

| Register $A$ |
| :---: |
| Register $B$ |
| Register C |
| Register D |

Example:
L W C,B ; Loads the contents of register $C$ to $B$

Register indirect Addressing

Examples:
L W 10,A ; Loads index address as byte number to A
L W I[A],D ; Loads status of I10 (Address in A) to register D

### 7.10.9 Indirect Addressing

The indirect addressing method - whether word/byte or bit-oriented uses an operand prefix containing the operand identifier and the operand address. This facilitates the handling and monitoring of operand addresses greatly.

In addition, all data and program modules can be called up indirectly.
The operand prefix is structured as follows:
OPD[R] OPD = Operand identifier
$[R] \quad=$ Operand address in register $A, B, C$ or $D$

Demonstration of the Indirect Addressing Principle, Using the Example of a Block Transfer:
Objective: Five input words on address 110 are to be transferred to marker words starting with address M50.

Indirect Byte addresses

| OPD ID | Byte Address (dec.) | Instructions | Example |  |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 0-47 | L | L | 10,A |
| 11 | 0-1 | L | L | I[A], B |
| 0 | 0-31 | L, T |  |  |
| 10 | 0 | T |  |  |
| Actual T value | 0-127 | L |  |  |
| Actual C value | 0-63 | L |  |  |
| M | 0-151 | L, T | L | 10,A |
| S | 0-255 | L, T | T | B,M[A] |
| DF | 0-8191 | L, T |  |  |
| D | 0-511 | L, T |  |  |
| DX | 0-511 | L, T |  |  |

To address the next byte and/or the next T/C when starting from an address, the address must be increased by 1. To address the next word, the address must be increased by 2.

In the event that an attempt is made to access a word by using an oddnumbered address (operand attribute $=\mathrm{W}$ ), the controller will enter the Stop state with address error.

The CL150 does not perform range monitoring. Accordingly, the programmer is responsible for staying within the range limits. In the case of write-access range limit violations, data will be destroyed.

## Indirect Bit Addresses

| OPD ID | Bit Address (dec.) | Instructions |  | Examples |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0-383 | A, AN, O, ON | $1 \mathrm{~L}$ | B | $\begin{aligned} & 10, \mathrm{~A} \\ & \mathrm{I}[\mathrm{~A}] \\ & \mathrm{M}[\mathrm{~A}] \end{aligned}$ |
| 0 | 0-255 | $\begin{aligned} & \mathrm{A}, \mathrm{AN}, \mathrm{O}, \mathrm{ON}, \\ & \mathrm{~S}, \mathrm{R},= \end{aligned}$ |  |  |  |
| M | 0-1215 | $\begin{aligned} & \mathrm{A}, \mathrm{AN}, \mathrm{O}, \mathrm{ON}, \\ & \mathrm{~S}, \mathrm{R},= \end{aligned}$ |  |  |  |
| S | 0-2047 | A, AN, O, ON |  |  |  |
| DF | 0-65535 | $\begin{aligned} & \mathrm{A}, \mathrm{AN}, \mathrm{O}, \mathrm{ON}, \\ & \mathrm{~S}, \mathrm{R},= \end{aligned}$ |  |  |  |
| T Status | 0-127 | A, AN, O, ON |  |  |  |
| C Status | 0-63 | A, AN, O, ON |  |  |  |

To address the next bit when starting from an address, the address must be increased by 1.

If a range limit violation is detected, the controller will enter the Stop mode. The cause of the fault can then be displayed by means of the programming unit.

## Indirect Module Addresses

| Operand | Module No. | Instructions | Example |  |  |
| :--- | :---: | :--- | :--- | :--- | :--- |
| DM | $0-127$ | CMx | L | W | $10, \mathrm{~A}$ |
|  |  | BXx | CM | $\mathrm{DM}[\mathrm{A}]$ |  |
| FC | $0-127$ | CMx | L | W | $100, \mathrm{~A}$ |
|  |  | BAx | CM | $\mathrm{FC}[\mathrm{A}]$ |  |

To address the next module starting from a module number, the module number must be increased by 1 .

If a range limit violation is detected, or if the module is not available, the controller will enter the Stop mode. In both cases, the fault can subsequently be displayed by means of the programming unit.

### 7.10.10 Parameterized Modules

In case of a program module call, up to 32 parameter values can be transferred. The number of transferred parameter values is stated as part of the module call-up instruction, followed by the actual parameters, starting with the number PO.

All parameters that are to be used as a byte or word in the module being called up are transferred without operand attribute.

All parameters to be used as bits in the module being called up are transferred with the operand attribute B!
$\Rightarrow$ If times and counters are transferred in the form of parameters without operand attribute, they may be utilized as both a word function, i.e., time/counter value, and a bit function, i.e., time/counter status, in the module which is to be called up.

Example of parameter transfer:

| CM | FC100,7 | ;Call up FC100 and transfer 7 parameters |
| :--- | :--- | :--- |
| P0 | 43 | ;Parameter P0: FC no. as decimal constant K43 |
| P1 | 4 | ;Parameter P1: DM no. as decimal constant K4 |
| P2 | O26 | ;Parameter P2: Output word with byte address O26 |
| P3 | I7.3 | ;Parameter P3: Input bit I7.3 |
| P4 | T2 | ;Parameter P4: Time T2 |
| P5 | C13 | ;Parameter P5: Counter C13 |
| P6 | O10.0 | ;Parameter P6: Output bit O10.0 |

Utilization of parameters in called-up module FC100:

| L |  | P1, A | ;Load DM no. 4 |
| :---: | :---: | :---: | :---: |
| CM |  | DM [A] | ; Open DM4 |
| CX |  | -DM5 | ; Open DM5 as 2. data module |
| L |  | PO, A | ;Load FC no. 43 |
| CM |  | FC [A], 2 | ; Call up FC43 and transfer two parameter values |
| PO |  | D2 | ; Parameter PO: D2 of active 1st DM, i.e. DM4 |
| P1 |  | DX6 | ; Parameter P1: DX6 of active 2nd DM, i.e. DM5 |
| L | W | P2, A | ;Load output word 026 |
| L | W | P4, B | ; Load time value from T2 to B |
| A | B | P3 | ;I7.3 |
| A | B | P4 | ;Status of T2 |
| A | B | P5 | ; Status of C13 |
| $=$ | B | P6 | ;010.0 |

### 7.11 Processing of the Interrupt Inputs

In the case of a signal change from $0 \rightarrow 1$, the interrupt inputs trigger the assigned peripheral interrupt. The response to the interrupt is programmed in the corresponding interrupt OM.

| Interrupt I 0 | OM10 | Priority 1 |
| :--- | :--- | :--- |
| Interrupt I 1 | OM11 | Priority 2 |
| Interrupt I 3 | OM12 | Priority 3 |

Minimal programming required for interrupt detection and processing:

```
L W 16#7,A ; Prepare all three interrupts for enabling
TIM W A,PI ;Write peripheral interrupt mask
EAI PI ;Enable interrupts
```

In the event that a signal transition occurs at one of the interrupt inputs, the associated OM will be called. If this module has not been integrated into the program, the controller will enter STOP mode while returning the corresponding error message. If several interrupts occur at the same time, they will be processed according to the above listed priority ranking.

### 7.12 Programming of High-Speed Counters

For high-speed counting and positioning tasks, the CL150 is provided with two independent 32-bit counters which can be operated in both upward and downward counting modes. The counting direction can be reversed either through the PLC program or externally, through special directional inputs.

In addition, the „Incremental Rotary Transducer" counter mode is available.

Incremental Rotary Transducer
The „Incremental Rotary Transducer" counter mode is available for counter 1, but not for counter 0.

This mode is enabled by setting the MSB in word 20 of the OM2. This makes all other bits in this word meaningless.

The maximum counter performance is 10 kHz and/or a line count of 10,000 per second.

At the same time, counter 0 may only be used without directional change.
In the event that the maximum counting rate of 10 kHz is used in the "Incremental Rotary Transducer" mode, a slow-down in the PLC cycle rate of approximately $35 \%$ can be expected. The response time to the inputs, in particular the interrupt response time is subject to the same influence.

The "Transducer" mode does not permit specified value monitoring.
The "Transducer" mode provides the PLC with a dual interpretation, i.e., both the rising and falling edges of pulses are counted. Accordingly, a rotary transducer with 1000 lines per revolution produces a counter value of 2000 with each revolution.

The permissible limit frequency of 10 kHz is not monitored. If the frequency limit is exceeded, counting errors will be the result.

In the event that the zero-pulse is to be used as an interrupt input, it must have a minimum duration of $80 \mu \mathrm{~s}$.

When using these counters, the OM2 is a mandatory requirement. All parameter values required for the counter are predefined in the data words DW13-DW27.

For utilization within the PLC program, the counter values and the required control bits can be accessed in S34-S58 of the system area.

Onboard counter settings (OCO: DW 13 / OC1: DW 20)
13/20 DEFW W 2\#0000000000000000B

Preset actual values, low/high word
OC0: DW 14/15 / OC1: DW 21/22
Values can be changed by means of the PLC program

| $14 / 21$ | DEFW | W | 0 |
| :--- | :--- | :--- | :--- |
| $15 / 22$ | DEFW | W | 0 |

Preset specified value 1, low/high word (with DW17/24 not for transducer mode).

OC0: DW 16/17 / OC1: DW 23/24
Values can be changed by means of the PLC program

```
16/23 DEFW W 16#FFFF
17/24 DEFW W 16#FFFF
```

Preset specified value 2, low/high word (with DW19/26 not for transducer mode).

OC0: DW 18/19 / OC1: DW 25/26
Values can be changed by means of the PLC program

| $18 / 25$ | DEFW | W | $16 \# F F F F$ |
| :--- | :--- | :--- | :--- |
| $19 / 26$ | DEFW W | $16 \# F F F F$ |  |

Upon reaching the specified values, the determined outputs in the output byte 0 can be set automatically if the function in OM2 (DW27) is enabled.

```
;DW 27: Bit number in the onboard output byte OO
;Upon reaching the specified values, output bits can be set
;To do so, the corresponding bits must be enabled in this word.
;T
i W WEFW 2#0000000000000000 ********** || reserved
```

The outputs are to be reset by means of the PLC program.

## System Area

| Address | Contents | Comments |
| :--- | :--- | :--- |
|  | Onboard Counter OC0/OC1 |  |

| :--- |

In the event that, during counting up (or counting down) the maximum value FFFFFFFFF $_{\mathrm{H}}$ (minimum value $0_{\mathrm{H}}$ ) is reached, the counter will again start at 0 (FFFFFFFF ${ }_{H}$ ).

The process of setting new actual/specified values is transition-controlled, and occurs in the following sequence:

- The "Set current/specified value" bit must be reset.
- In the system word, the new current/specified value is preset, and the "Set current/specified value" control bit is set once (never cyclically).
- In the subsequent cycle, the value will be transferred and the control bit will be deleted. In the case of actual value manipulations, the system variable again is used as the current display of the actual values.

The updating of actual values in the system area occurs, without exception, in the I/O state. Irrespective of the program processing, the outputs assigned to the specified values are affected immediately.
$\Rightarrow$ To prevent the loss of pulses, the default entry for change of direction and for counting pulses must not occur simultaneously.

## Program Example

```

### 7.13 Programming of Analog Interface CL150A/CL151A

For the processing of analog values, the CL150A and the CL151A are provided with two analog inputs and one analog output. Additional analog in- and outputs are available at the $\mathrm{B} \sim \mathrm{IO}$ modules.

For usage within the PLC program, the analog values and the cable-break messages of the analog inputs are accessible in the system area S64S82.

When the controller is switched on without the OM2, the processing of all analog inputs within a voltage range of $0-10 \mathrm{~V}$ is enabled.

## OM2 Settings

OM 2 is not an indispensable requirement.
To enable the control processor to restrict processing to channels actually in use, assigned analog inputs are specified in DW 31.

```
;DW 31: Number of used analog inputs (entries permitted)
*--------------------------------------------
    0 = no analog input enabled
    2 = two analog inputs enabled (channel 0 and 1)
```

Select whether or not and which analog inputs are to be standardized and/or whether the analog output is to be standardized.

```
;DW 32: Standardization of the analog channels (entries permitted)
```

```
                Entry 1 = Function available and/or to be executed
                The selected analog inputs are standardized to 2V - 10V
                and the enabled analog output is standardized to 2V - 10V
                and/or to
                Entry 0 turns standardization off
    DEFW W
```

### 7.13.1 Analog Inputs

The voltage value present at the analog inputs is converted and subsequently written into the system area for further processing in digital form.

If a cable break is detected during standardized operation (value $<4 \mathrm{~mA}$ and/or $<2 \mathrm{~V}$ ), this will be reported in word S 80 of the system area.

|  | Analog Inputs |
| :--- | :--- |
| S64 | Analog input value channel 0 |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | x | x | x | X | X | x |
| MSB |  |  |  |  |  |  |  |  | LSB |  |  |  |  |  |  |

LSB voltage value without standardization: $10 \mathrm{~V} / 1024=9.8 \mathrm{mV}$
LSB voltage value with standardization: $\quad 8 \mathrm{~V} / 1024=7.8 \mathrm{mV}$

The PLC program writes into the system area the digital representation of the voltage or current output value that is to be output, and transfers it to the output in the I/O state.

| T | W | C | M10 |  |
| MUL | W | 1234 | D |  |

### 8.2 Flags

The flags (status bits) are influenced by the following instruction groups:

- Compare
- Convert
- Swap
- Increment, decrement
- Shift
- Rotate
- Add
- Subtract
- Multiply
- Divide

They are equally applicable in program processing instructions (jumps, module instructions) and logical links (flag queries). Also refer to

- 8.17.1 Jumps
- 8.17.2 Module Calls
- 8.17.3 End of Module Instructions
- 8.8 Compare Instruction

| Flags | PG Display | JP... CM... | Flag Query |  | Explanation |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & C Y=1 \\ & C Y=0 \end{aligned}$ | C | $\begin{array}{\|l\|} \hline \ldots \mathrm{C} \\ \ldots . . \mathrm{CN} \\ \hline \end{array}$ | $\begin{array}{\|l\|} \hline \text { A } \\ \text { AN } \end{array}$ | $\begin{aligned} & \mathrm{CY} \\ & \mathrm{CY} \end{aligned}$ | Carry Carry Not |

### 8.5 Time Programming

### 8.5.1 Time Instructions

Time starts are activated only when the RES signal undergoes a transition from ${ }_{0} \uparrow{ }^{1}$.

Prior to the time start, the time value is loaded into the used register.
Reset and stop functions of times are always static and RES signaldependent.

The time status for logical links is instruction-dependent, and appears in the time diagrams.

### 8.6 Counter Instructions

### 8.6.1 Software Counter

The setting of the counter and the up- and downwards counting are activated only when the RES signal undergoes a transition from ${ }_{0} \uparrow{ }^{1}$.

Beforehand, the required counter value is loaded into the used register.
Counter reset functions are statical and RES signal-dependent.
The counter status for logical links depends on the counter content. For counter values $>0$, the status is $=1$; for counter values $=0$, the status is $=0$.

### 8.10 Convert Instructions

| Control Instruction |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  |  | Length Byte | Time $\mu \mathrm{S}$ | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | CY | 0 | N | Z |  |  |  |  |  |  |
| BID | W | R |  |  |  |  | $\bullet$ |  |  | 0 | - | 0 | - | 10 | $\begin{aligned} & 26.4 \\ & 18.3 \end{aligned}$ | $\begin{array}{\|l\|} \hline \mathrm{BID} \\ \mathrm{BID} \end{array}$ | $\begin{aligned} & \hline \text { W } \\ & \text { B } \end{aligned}$ | $\begin{aligned} & \hline \text { A } \\ & \text { B } \end{aligned}$ | Binary $\rightarrow \mathrm{BCD}$ (decimal). Result $>9999$ sets the overflow bit |
| DEB | W | R |  |  |  |  | - |  |  | 0 | - | 0 | - | 10 | $\begin{aligned} & \hline 28.0 \\ & 17.9 \end{aligned}$ | $\begin{array}{\|l\|} \hline D E B \\ D E B \end{array}$ | $\begin{aligned} & \hline \mathrm{W} \\ & \mathrm{~B} \end{aligned}$ | $\begin{aligned} & \hline \text { C } \\ & \text { D } \end{aligned}$ | BCD (decimal) $\rightarrow$ Binary. Incorrect BCD encoding sets the overflow bit. |
| TC | W,B | R |  |  |  |  | - |  |  | - | - | - | - | 6 | 0.9 | $\begin{aligned} & \mathrm{TC} \\ & \mathrm{TC} \end{aligned}$ | $\begin{aligned} & \hline \text { W } \\ & \text { B } \end{aligned}$ | $\begin{aligned} & \hline \mathrm{A} \\ & \mathrm{~B} \end{aligned}$ | Converts the register's contents to the two's complement |
| N | W, B | R |  |  |  |  | - |  |  | 0 | - | 0 | - | 8 | 1.2 | $\begin{aligned} & \mathrm{N} \\ & \mathrm{~N} \end{aligned}$ | $\begin{aligned} & \hline \text { W } \\ & \text { B } \end{aligned}$ | $\begin{aligned} & \hline \text { C } \\ & \text { D } \end{aligned}$ | Negates the register's contents (one's complement). |

Representation of Positive and Negative Numbers
A negative number corresponds to the two's complement of the positive number.

Example:

$$
\begin{array}{r}
0110 \\
1001 \\
+\quad 1 \\
\hline 1010
\end{array}
$$

positive number 6 Negation and/or one's complement
two's complement $=$ negative number 6
In the case of word operations, the differentiation between positive and negative number is determined by Bit 15. In the case of byte operations, it is determined by Bit 7 .

Word: Bit $15=0 \quad$ Byte: Bit $7=0$ positive number

$$
\text { Bit } 15=1
$$

Bit $7=1$ negative number

## Range of Numbers

### 8.11 Swap Instruction

| Control Instruction |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  |  | Length Byte | Time $\mu \mathrm{S}$ | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | CY\| | 0 | N | Z |  |  |  |  |  |  |
| SWAP | W | R |  |  |  |  | $\bullet$ |  |  |  |  |  |  | 4 | 0.6 | SWAP | W | A | Byte swap in registers, High byte <br> $\leftrightarrow$ Low byte |

### 8.12 Stack Instructions

The available stack area comprises 128 words.
In the event of underflow, bit S28.4 is set in the system area; overflow sets system area bit S28.5.

The I/O state deletes the entire application stack.

| Control Instruction |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  |  | Length Byte | Time $\mu \mathrm{s}$ | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | CY | 0 | N | Z |  |  |  |  |  |  |
| PUSH | W | R |  |  |  |  | $\bullet$ |  |  |  |  |  |  | 4 | 7.5 | PUSH | W | A | Saves the register contents to the application stack and lowers the stack address . |
| POP | w | R |  |  |  |  | - |  |  |  |  |  |  | 4 | 7.5 | POP | W | B | Raises the application stack address and reads the saved contents from the stack. |

### 8.13 Increment, Decrement

Increment/decrement the contents of SRC:

- by number $\mathrm{n}, \mathrm{n}=1$ to 7
- with $\mathrm{n}=0$ and with [C] by the number stored in C , max. 7 .

| Control Instruction |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  |  | Length |  | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | CY | 0 | N | Z | Byte | $\mu \mathrm{S}$ |  |  |  |  |
| INC | W,B | R | $\begin{array}{cc}\text {, } & 0 \\ \text {, } & {[C]}\end{array}$ |  |  | - | - | - |  |  | $\bullet$ | $\stackrel{-}{\bullet}$ | $\stackrel{\square}{\bullet}$ | $\begin{gathered} 6 \\ 10 \\ 10 \end{gathered}$ | $\begin{aligned} & \hline 0.9 \\ & 1.5 \\ & 1.5 \end{aligned}$ | $\begin{aligned} & \text { INC } \\ & \text { INC } \\ & \text { INC } \end{aligned}$ | $\begin{aligned} & \hline B \\ & W \\ & W \\ & W \end{aligned}$ | $\begin{aligned} & \mathrm{A}, 5 \\ & \mathrm{~B}, \mathrm{O} \\ & \mathrm{~B}, \mathrm{Cl} \end{aligned}$ | Raise (increment) the contents of SRC. |
| DEC | W,B | R |  |  |  | - | - | - |  |  | $\bullet$ | $\bullet$ | - | 6 10 10 | $\begin{aligned} & 0.9 \\ & 1.5 \\ & 1.5 \end{aligned}$ | $\begin{array}{\|l\|l} \hline \text { DEC } \\ \text { DEC } \\ \text { DEC } \end{array}$ | $\begin{aligned} & \hline B \\ & W \\ & W \\ & W \end{aligned}$ | $\begin{aligned} & A, 5 \\ & B, 0 \\ & B,[C] \end{aligned}$ | Lower (decrement) the contents of SRC. |

### 8.13.1 Shift Instructions

Shift the contents of SRC:

- by number $n$
- with $\mathrm{n}=0$ and with [C], by the number stored in C
with $O P A=W, n=1$ to 15
with $O P A=B, n=1$ to 7

| Control Instruction |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  |  | Length |  | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | \|CY| | O | N | Z | Byte | $\mu \mathrm{S}$ |  |  |  |  |
| SLR | W, B | R | $\begin{array}{cc} , & n \\ , & 0 \\ , & {[C]} \end{array}$ |  |  | - | - | - |  | $\stackrel{-}{\bullet}$ |  | 0 0 0 | $\stackrel{\bullet}{\bullet}$ | $\begin{gathered} \\ \hline 6 \\ 10 \\ 10 \end{gathered}$ | $\begin{aligned} & 0.9^{*} \\ & 1.5 \\ & 1.5 \end{aligned}$ | $\begin{aligned} & \hline \text { SLR } \\ & \text { SLR } \end{aligned}$ | $\begin{aligned} & \mathrm{W} \\ & \mathrm{~B} \end{aligned}$ | $\begin{aligned} & \hline \mathrm{A}, 7 \\ & \mathrm{~B},[\mathrm{C}] \end{aligned}$ | Logical SHIFT right <br> * applies to W, for B $+0.6 \mu \mathrm{~s}$ |
| SLL | W,B | R | $\begin{array}{cc} , & n \\ , & 0 \\ , & {[C]} \end{array}$ |  |  | - | - | - |  | $\stackrel{\bullet}{\bullet}$ |  | 0 0 0 | $\stackrel{-}{\bullet}$ | $\begin{gathered} \hline 6 \\ 12 \\ 12 \end{gathered}$ | $\begin{aligned} & \hline 0.9^{*} \\ & 1.8 \\ & 1.8 \end{aligned}$ | $\begin{aligned} & \hline \begin{array}{l} \text { SLL } \\ S L L \end{array} \end{aligned}$ | $\begin{aligned} & \hline \text { W } \\ & \text { B } \end{aligned}$ | $\begin{aligned} & \hline \mathrm{A}, 7 \\ & \mathrm{~B},[\mathrm{C}] \end{aligned}$ | Logical SHIFT left <br> * applies to W, for B $+0.9 \mu \mathrm{~s}$ |
| SAR | W, B | R | $\begin{array}{cc} & \\ , & n \\ , & 0 \\ , & {[C]}\end{array}$ |  |  | - | $\bullet$ | - |  | 0 | $\stackrel{\rightharpoonup}{\bullet}$ | $\bullet$ | - | 6 10 10 | $\begin{aligned} & \hline 0.9^{*} \\ & 1.5 \\ & 1.5 \end{aligned}$ | $\begin{aligned} & \hline \begin{array}{l} \text { SLL } \\ S L L \end{array} \end{aligned}$ | $\begin{aligned} & \hline \text { W } \\ & \text { B } \end{aligned}$ | $\begin{aligned} & \hline \mathrm{A}, 7 \\ & \mathrm{~B},[\mathrm{C}] \end{aligned}$ | Arithmetical SHIFT right * applies to W, for B $+0.6 \mu \mathrm{~s}$ |

Logical SHIFT

Arithmetical SHIFT
All bits being vacated are filled up with the contents of the MSB.
SAR W A,n

In the case of shift operations exceeding one space ( $n>0$ ), the overflow bit is set after a " 1 " was shifted through CY.

### 8.13.2 Rotation Instructions

Shift the contents of the SRC:

- by number $n$
- with $\mathrm{n}=0$ and with [C], by the number stored in C
with OPA $=W, \mathrm{n}=1$ to 15
with $O P A=B, n=1$ to 7

| Control Instruction |  |  |  |  |  | Addr. |  |  | Flag |  |  |  |  | Length | Time | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | CY | 0 | N | Z | Byte | $\mu \mathrm{S}$ |  |  |  |  |
| ROR | W, B | R | $\begin{array}{cc} n \\ , & 0 \\ , & {[C]} \end{array}$ |  |  | $\bullet$ | - | - |  | - | - | $\stackrel{-}{\bullet}$ | $\stackrel{-}{\bullet}$ | 6 12 12 | 0.9* | $\begin{array}{\|l} \hline \text { ROR } \\ \text { ROR } \\ \text { ROR } \end{array}$ | $\begin{aligned} & \hline B \\ & W \\ & W \end{aligned}$ | $\begin{aligned} & \hline \mathrm{A}, 7 \\ & \mathrm{~A}, 0 \\ & \mathrm{~B},[\mathrm{C}] \end{aligned}$ | Rotate right <br> * applies to W, for B + $0.9 \mu \mathrm{~s}$ |

| RCL | W,B | R | $\begin{array}{cc} \hline, & n \\ , & 0 \\ , & {[C]} \end{array}$ |  |  | - | - | - |  | $\bullet$ | - | $\bullet$ | $\stackrel{\bullet}{\bullet}$ | 8 | 8.1* | $\begin{aligned} & \mathrm{RCL} \\ & \mathrm{RCL} \\ & \mathrm{RCL} \end{aligned}$ | $\begin{aligned} & \hline B \\ & W \\ & W \\ & W \end{aligned}$ | $\begin{aligned} & \hline \mathrm{A}, 7 \\ & \mathrm{~A}, \mathrm{O} \\ & \mathrm{~B},[\mathrm{C}] \end{aligned}$ | $\begin{aligned} & \text { Rotate through CARRY left } \\ & * 8.1 \mu \mathrm{~s}+2.4 \mu \text { s per bit with W } \\ & * 8.6 \mu \mathrm{~s}+3.0 \mu \text { s per bit wth B } \\ & \hline \end{aligned}$ |

Rotate right

ROR W A,n

Rotate left

ROL W A,n

Rotate through CARRY right
RCR W A,n

Rotate through CARRY left

RCL W B,n

With Rotate instructions by more than one digit, the following occurs:

- The overflow bit is set when a "1" has passed through CY.
- The negative bit is set, when the MSB contains a "1".

MSB: Bit 7 when OPA = BY
MSB: Bit 15 when OPA $=W$

### 8.14 Arithmetics

### 8.14.3 Multiplication Instructions

| Control Instruction |  |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  | Length Time |  |  | Example |  |  | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC |  |  | A | E | D | R | [R] | V | CY | 0 | N | Z | Byte | $\mu \mathrm{S}$ |  |  |  |  |
| MUL | W,B | Constant $R$ | , | R |  |  | - | - |  |  | 0 | 0 | $\bullet$ | $\bullet$ | 10 10 | $\begin{array}{\|l\|} \hline 11.1^{*} \\ 10.8^{*} \end{array}$ | $\begin{aligned} & \text { MUL } \\ & \text { MUU } \end{aligned}$ | $W_{B}^{W}$ | $\begin{aligned} & 100, A \\ & B, A \end{aligned}$ | Fixed point multiplication of signed integers. * applies to $B$, with $W+2.0 \mu \mathrm{~s}$ |

The product of any multiplication operation always occupies twice the width of the starting operands.

MUL B D,A
SRC operand byte
DEST operand byte
DEST operand word

MUL W B,A
SRC operand word
DEST operand word

DEST operand word
DEST operand word + 1

### 8.14.4 Division Instructions

| Control Instruction |  |  |  | RG |  | Addr. |  |  | Flag |  |  |  |  | Length | Time | Example |  |  | Comment |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OPP | OPA | SRC | DEST | A | E | D | R | [R] | V | CY\| | 0 | N | Z | Byte | $\mu \mathrm{S}$ |  |  |  |  |  |
| DIV | W,B | ${ }_{\text {Constant }}$ | R |  |  | - | - |  |  | 0 | $\bullet$ | $\bullet$ | $\bullet$ | 10 10 | $\begin{array}{\|l\|} \hline 14.0^{*} \\ 13.7^{*} \end{array}$ | DIV | W | $\begin{aligned} & 100, \mathrm{~A} \\ & \mathrm{~B}, \mathrm{~A} \end{aligned}$ |  | xed point division of signed integer. applies to $W$, with $B+0.8 \mu \mathrm{~s}$ |

The dividend DEST of any division operation occupies twice the width of the divisor SRC. The result of the division is located in DEST.

## Operand Attribute $=$ Byte

DIV B D,A
DEST operand word
SRC operand byte

DEST operand word, register A

## Operand Attribute $=$ Word

DEST operand word +1

In order to facilitate the entry, the following instruction can be used:
L D 16\#FFFFEEEE,A
Then, FFFF is located in register $B$ and EEEE in register $A$.
In the case of a division by 0 , the division instruction will not be carried out and the overflow bit will be set.

The overflow bit will also be set if the result is $> \pm 32768$.
When the overflow bit is set, the status of the negative bit is undefined.

### 8.15 Definitions

### 8.15.1 Parameter Assignments

| RCY |  |  |  |  |  |  |  |  |  | $\cdot$ |  |  |  | 2 | 0.3 |  | Set CARRY flag unconditionally to 0 . |

### 8.17 Program Processing Instructions

### 8.17.1 Jumps

Jump operations may be executed unconditionally and also in dependence of a binary link and/or mathematical operation. With one exception, namely JP [R], jump operations are programmed symbolically.

The entry point must be located at the start of a program rung.
The given instruction execution time stands for the condition satisfied/not satisfied.

The jump instruction JP [R] causes an unconditional jump whose destination must always be a jump instruction. This instruction is designed for easy realization of jump distributors. The controller goes into Stop if the entry point is not a jump instruction. Then, the error status of the programming unit indicates the cause of the error.

## Example

PLC Program Interlude
Jump distance calculation in register $A$ for the following jump sequence $A$ may contain odd values $(1,3,5, \ldots)$ only.

| may contain odd values $(1,3,5, \ldots)$ only. |  |  |  |

| SMST |  | R |  |  |  |  | $\bullet$ |  |  |  |  |  |  | 8 | 13.6 bis 17.8 | SMST | A | depends on CEN, RES and R/A |
| LMST |  |  | R |  |  |  | - |  |  |  |  |  |  | 8 | 10 | LMST | B |  |

SMST <Register> Start/Control instruction for 1 ms timer
The 1 ms timer is directly assigned to a micro controller hardware timer. This makes parallel processing possible without a negative impact on the program processing time.

The 1 ms timer can create times of up to 400 ms with an accuracy of $6.4 \mu \mathrm{~s}$.

In the event of timer end or timer overflow the flag S31.7 is set in the system area.

If OM17 is linked to the program, it is automatically called at timer end and timer overflow.

The following information can be expected to appear in the designated register:

## CEN, Count-Enable

- $0=$ Timer Stop
- 1 = Timer Start

RES, Reset

- $0=$ Actual timer value remains
- 1 = Actual timer value is reset

R/A, „Rund/Ablauf"
R/A stands for the following: $R=$ Timer runs cyclically; $A=$ Timer runs one time only and stops at the end of the operation

- $0=$ At the end of its operation, the timer automatically stalls
- 1 = Timer runs cyclically

LMST <Register> Read instruction for 1 ms timer
Reads the actual timer value with an accuracy of 0.1 ms from the micro controller.

## 9 Fieldbus Connections

Our product line comprises the following versions with fieldbus connection:

| Designation | Order no. | Function |
| :--- | :--- | :--- |
| B~IO CL150-DP | 1070081304 | CL150 with PROFIBUS-DP slave connection, real time clock |
| B~IO CL151-DP | 1070081463 | CL150 with PROFIBUS-DP slave connection, real time clock and 2. <br> serial interface |
| B~IO CL150-CAN | 1070081467 | CL150 with CANopen slave connection, real time clock |
| B~IO CL151-CAN | 1070081470 | CL150 with CANopen slave connection, real time clock and 2. serial <br> interface |
| B~IO CL150-DEV | 1070081473 | CL150 with DeviceNet slave connection, real time clock |
| B~IO CL151-DEV | 1070081476 | CL150 with DeviceNet slave connection, real time clock and 2. serial <br> interface |
| B~IO CL150-IBS | 1070081386 | CL150 with Interbus-S slave connection, real time clock <br> B~IO CL151-IBS <br> 1070081453CL150 with Interbus-S slave connection, real time clock and 2. serial <br> interface |

This manual is limited in its descriptions of the relevant fieldbus interfaces of these CL150 versions; it contains only such information that is essential for programming and operating the modules.

More detailed information about the fieldbus systems are not included. The only difference between the CL150 and CL151 fieldbus version is a second serial interface. Below, the designation CL150 is also applicable to the CL151 versions.

### 9.1 Switching Matrix

For the purpose of communication with the primary control, the host PLC, a switching matrix has been defined.

The structure of the switching matrix is equal for all fieldbus versions. The only difference is its data width.

This switching matrix comprises the following functions:

- Synchronization of the decentralized controller with the host controller;
- Transfer of status messages from the decentralized controller to the host controller;
- User-defined data transfer from the decentralized controller to the host controller.

During the programming and configuration of the host controller, addresses are assigned to the switching matrix by means of the corresponding fieldbus‘ configuration tools.

For Bosch controllers, these are I/O and/or EI/EO addresses (EI = Extended Input; EO = Extended Output).

| Host Controller |
| :--- |
| Output field |
|  |
| Input field |
|  |

Switching Matrix

| Control word bit 0-7 | $\Rightarrow$ |
| :---: | :---: |
| Control word bit 8-15 | $\Rightarrow$ |
| Data field Host $\rightarrow$ Slave | $\Rightarrow$ |
| $\ldots$ | $\Rightarrow$ |
| $\ldots$ | $\Rightarrow$ |
| $\ldots$ | $\Rightarrow$ |
| Status word bit 0-7 | $\Leftarrow$ |
| Status word bit 8-15 | $\Leftarrow$ |
| Data field Host $\leftarrow$ Slave | $\Leftarrow$ |
| $\ldots$ | $\Leftarrow$ |
| $\ldots$ | $\stackrel{1}{ }$ |
| $\ldots$ | $\Leftarrow$ |

*: The start address of the switching matrix is entered in OM2.
The switching matrix basically consists of

- a control word bit 0-15,
- a status word bit 0-15
- and a data field for Host $\rightarrow$ Slave and for Host $\leftarrow$ Slave with variable size.

By principle, the width of the data field for Host $\rightarrow$ Slave and the one for Host $\leftarrow$ Slave are equal in size and symmetrical.

By principle, the maximum width of the switching matrix in the CL150's data field is 64 byte Read and 64 byte Write.

The switching matrix start address n can be set in the OM2. The data direction is predefined:

- DFn through DFn+63 for Read, data direction Host $\rightarrow$ Slave
- DFn+64 through DFn+127 for Write, data direction Host $\leftarrow$ Slave

In the fieldbus connections, the used data width of the switching matrix can be set individually.

## Control Word, Data Direction Host $\rightarrow$ Slave

If Control_Enable is set $=1$ in the OM2 (DW2, bit 4), the bits $0-7$ are evaluated by the operating program.

If Control_Enable is set $=0$, the bits $0-7$ are ignored by the operating program.

| Bit | Designation | Explanation | Function |
| :---: | :--- | :--- | :--- |
| 0 | RUN_REQ | run_request | O: CL150 remains in Stop |
|  |  |  | 1: CL150 goes into Run, if no other stop source is present. |
| 1 | OUT_EN | output_enable | 0: CL150 goes into „disabled outputs" |
|  |  |  |  |
| 2 to 7 | reserved |  |  |
| 8 to 15 | control flags: here, application-oriented control and synchronization flags can be determined. |  |  |

Status Word, Data Direction Host $\leftarrow$ Slave

| Bit | Designation | Explanation | Function |
| :---: | :---: | :---: | :---: |
| 0 | RUN | operating state | 0: CL150 is in Stop <br> 1: CL150 is in Run |
| 1 | Stop_on_user | Stop state by operation | 0 : No stop source by operation could be detected 1: A stop source by operation is available: <br> Stop request through <br> - programming unit <br> - switch <br> - digital input |
| 2 | PLC-Program not available | no PLC program loaded | $0:$ PLC program is loaded <br> 1: PLC program is not loaded |
| 3 |  |  | reserved |
| 4 | DIAG | Diagnosis | 0 : no diagnosis available <br> 1: a group diagnosis is available, identical with the entry in system area S31.0 |
| 5 | DIAG_on_user | User diagnosis | With regard to system area S90.0, a user diagnosis can be generated: <br> 0: User diagnosis inactive <br> 1: User diagnosis active |
| 6 |  |  | reserved |
| 7 | VALID | Status word is valid | 0 : Status word is not valid <br> 1: Status word is valid and can be evaluated by user |
| 8 to 15 | status flags: here, the user can determine freely definable status and synchronization flags. |  |  |

### 9.2 PROFIBUS-DP Interface

B~IO CL150-DP and CL151-DP provide a PROFIBUS-DP interface as per EN50170-2.

| Type | RS485 |
| :--- | :--- |
| Electrical isolation | yes |
| Baud rate | up to 12 MBaud |
| DP connection | 9 -pin socket connector D-SUB |
| Terminal address | set via 2 rotating encoding switches |

The interface can be used as a slave interface only.
A Device Data Base File (DDBF) as per EN50170-2-DP is delivered together with the CL150-DP.

This file contains data for connecting the module to any DP master (as per EN 50170-2-DP). The manufacturer of the master delivers and/or defines the relevant configuration tools.

The bus station number BTN is set by means of the rotary encoding switches on the device.

## Pin Assignment

| Pin No. | Designation | Explanation |
| :--- | :--- | :--- |
| 1 |  |  |
| 2 |  |  |
| 3 | RxD/TxD | Received/Transmitted Data - P |
| 4 | CNTR_P | Repeater Control Signal - P |
| 5 | DGND | Data Reference Potential |
| 6 | VP | Supply Voltage Plus |
| 7 |  |  |
| 8 | RxD/TxD_N | Received/Transmitted Data - N |
| 9 | DGND | Repeater Control Signal - N |

## Baud Rates

The CL150-DP automatically recognizes the baud rate that has been set in the PROFIBUS-DP. Baud rates of 9.6 kBaud up to 12 MBaud are supported.

## Bus Station Address

The bus station address of the B~IO CL150-DP is set decimally by means of the two rotating encoding switches S3 and S4. S3 specifies the ten's digit, S4 the unit's digit.

Addresses are possible from 2 through 99. Each address may be specified for each PROFIBUS-DP one time only.

The set address will be established by the CL150 when the power supply is switched on. An alteration of the set address during operation takes effect only the next time the power supply is switched on.

## Indication of the DP Interface

The operating states of the DP interface are indicated by 2 light emitting diodes (LEDs):

Explanations:

| $O$ | LED is not lit |
| :--- | :--- |
| - | LED is lit |

| BUS | $\bullet$ green | Bus connection is in normal operation, no <br> error display |
| :--- | :--- | :--- |
|  | O | Error |
| BF | Ored | Bus error (baud rate, bus station address, bus <br> cable) |
|  | O | Bus without error |

## Switching Matrix

## Consistency

## Device Data Base File DDBF

The DDBF as per DIN EN 50170-2 contains all data necessary for connecting the B~IO CL150-DP to any DP master. The file is evaluated by the DP configuration program.

The DDB-File's name for B~IO CL150-DP is RBxx0119.GSD; $x x$ indicates the release.

### 9.3 CANopen Interface

OSI
The model of the CANopen communication is oriented towards the ISO/OSI Basic Reference Model.

## Reference:

- ISO 7498, 1984, Information Processing Systems - Open System Interconnection - Basic Reference Model

The lower layers of the Basic Reference Model are based on CAN.

## Reference:

- Robert Bosch GmbH, CAN Specification 2.0 Part B, September 1991
- ISO 11898, November 1993, Road Vehicles, Interchange of Digital Information - Controller Area Network CAN for high-speed Communication

## CANopen

All CANopen requirements and guidelines are located in the CiA specifications.

## Reference:

- CiA/DS 102,CAN Physical Layer for Industrial Applications
- CiA/DS 201, CAN Reference Model, February 1996
- CiA/DS 202-1, CMS Service Specification, February 1996
- CiA/DS 202-2, CMS Protocol Specification, February 1996
- CiA/DS 202-3, CMS Encoding Rules, February 1996
- CiA/DS 203-1, NMT Service Specification, February 1996
- CiA/DS 203-2, NMT Protocol Specification, February 1996
- CiA/DS 204-1, DBT Service Specification, February 1996
- CiA/DS 204-2, DBT Protocol Specification, February 1996
- CiA/DS 205-1, LMT Service Specification, February 1996
- CiA/DS 205-2, LMT Protocol Specification, February 1996
- CiA/DS 206, Application Specific Data Types, February 1996
- CiA/DS 207, Application Layer Naming Specification, Feb. 1996
- CiA/DS 301, CAL-based Communication Profile, Oct. 1996

| Electrical isolation | yes |
| :--- | :--- |
| Baud rate in kbaud | $10 / 20 / 50 / 125 / 250 / 500 / 1000$ |
| CAN connection | $9-$ pin inline contact strips D-SUB |

## Connection

The CANopen is connected through a 9-pin D-SUB socket which is screwed to the X71 D-SUB connector of the CL150-CAN.

The connection assignments correspond to the CANopen standards:

- CIA/DS 102, CAN Physical Layer for Industrial Applications Feb. 1996
- CiA/DS 301, CAL-based Communication Profile, Oct. 1996.

| Pin | Signal | Explanation |
| :---: | :--- | :--- |
| 1 |  | Reserved |

Node ID, DIP Switch S4

Each bus connection at the CANopen must receive its own node ID. A bus station address can be assigned one time only in the entire CANopen. The node ID 1 to 127 of the CL150-CAN bus connection is set by means of the S4 DIP switch.

## 87654321

ON

| SW7 to SW1 | Node ID 1 to 127 |
| :--- | :--- |
| SW8 | reserved |

| Node ID | SW7 | SW6 | SW5 | SW4 | SW3 | SW2 | SW1 | Comment |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | off | off | off | off | off | off | off | not usable |
| 1 | off | off | off | off | off | off | on |  |
| 2 | off | off | off | off | off | on | off |  |
| 3 | off | off | off | off | off | on | on |  |
| 4 | off | off | off | off | on | off | off |  |
| $\ldots$ |  |  |  |  |  |  |  |  |
| 126 | on | on | on | on | on | on | off |  |
| 127 | on | on | on | on | on | on | on | not permitted <br> with more than <br> 16 I-bytes or <br> 16 O-bytes. |

The address of a node ID must not be set to 0 . The setting node ID = 0 leads to a system halt.

The set node ID is reread upon Power-On, after „NMT Reset Node" and after „NMT Reset Communication" of the CL150-CAN bus module.

An alteration of the node ID during operation will only take effect after one of the above mentioned events.

The bus station address can be written onto the labeling field on the front panel.

Ex works: Node ID = 1 .

## Indication of the CAN Interface

The operational state of the CAN interface is indicated by 2 LEDs:
Explanations:

| $O$ | LED is not lit |
| :--- | :--- |
| - | LED is lit |
|  | LED flashes |

| BUS | - green | Bus connection is in operational mode |
| :---: | :---: | :---: |
|  | green | Bus connection is in preoperational mode <br> - Slave has not yet received an NMT_Start node message <br> - Guarding failure <br> - Synchronization error, missing PDOs in SYNC mode <br> - CAN master has set Slave into preoperational mode, due to the following: <br> - NMT_RESET_NODE <br> - NMT_RESET_COM <br> - NMT_STOP <br> - NMT_DISCONNECT <br> - NMT PREOPERATIONAL |
|  | 0 | Bus connection is in initialization mode <br> - Wrong node ID, node ID $=0$ or node ID $>127$ <br> - Partner not reachable <br> - remaining CAN bus stations switched off. <br> - Bus cable removed, defect or faulty <br> - Incorrect baud rate has been selected |
| BF | - red | Bus off |
|  | red | - Invalid node ID, node ID = 0, or node ID > 127 <br> - Synchronization error, a SYNC message has been received in SYNC mode, without prior transmission of the correct number of PDOs. <br> - Bus Warning Level exceeded |
|  | 0 | Bus o.k. |

## Switching Matrix

The length of the switching matrix is limited to a maximum of 32 input bytes and 32 output bytes and a maximum of 4 PDOs each for receiving and sending, 8 byte per PDO.

The length of the switching matrix can be set by means of DIP switches or configurated by using CAN.

## Consistency

The consistency of the transfer data can be set by means of the WinCAN configuration software as to the extent of a PDO. Therefore, consistency can be guaranteed for transferring a maximum of 8 bytes. The operating system of the B~IO CL150-CAN module processes the switching matrix coherently in the I/O cycle of the controller. Thus, the consistency settings also apply to the contents of the switching matrix.

## Electronic Data Sheet EDS

The EDS is a CiA specified ASCII file which describes the objects of a CANopen device. This file is available for the CL150-CAN module and is named RBxxCL15.EDS; $x x$ indicates the release.

The EDS can be read into certain CANopen configuration tools, e.g. the Nodemaster configuration tool by Vektor, which provides the user with a comfortable configuration solution.

### 9.4 DeviceNet Interface

Requirements and guidelines from Open DeviceNet Association, Inc.
(ODVA):

- DeviceNet Specification Volume I, Release 2.0
- DeviceNet Communication Model and Protocol
- DeviceNet Specification Volume II, Release 2.0
- DeviceNet Device Profiles and Object Library

| Electrical isolation | yes |
| :--- | :--- |
| Baud rate in kbaud | $125 / 250 / 500$ |
| Connector | 5-pin Open Style Connector |

## Connection

## DIP Switch S3

The DeviceNet is connected through a 5-pin connector according to the DeviceNet specifications: Pluggable Open Connector. The connection assignment corresponds to the DeviceNet standard: DeviceNet Specification Volume 1, Release 2.0.

| Pin | Signal | Explanation |
| :--- | :--- | :--- |
| 5 | V+ | 24V bus power supply |
| 4 | CAN + | CAN_H bus line, dominant high |
| 3 | Shield | Shield |
| 2 | CAN- | CAN_L bus line, dominant low |
| 1 | V- | GND bus power supply |
| Table 5: $X 71$ Connector, DeviceNet |  |  |

Table 5: X71 Connector, DeviceNet

The baud rate and the switching matrix length are set by means of the DIP switch S3.

## 87654321

1111111
ON

| 4 | off | off | off | on | off | off |
| $\ldots$ |  |  |  |  |  |  |
| 63 | on | on | on | on | on | on |

Table 8: Setting the MAC ID

The DIP switch S4 is read upon the following events:

- After switching on the 24 V supply UI
- After receiving the „Reset all connection objects" message
- After switching on the bus power supply
- Upon Re-Init after Bus-Off

An alteration of the MAC ID during operation will only take effect after one of the above mentioned events. The bus station address can be written onto the labeling field on the front panel.

## Indication

The operational states of the CL150-DEV bus connection are indicated by 2 LEDs:

Explanations:

| $O$ | LED is not lit |
| :--- | :--- |
|  | LED is lit |
|  | LED flashes |

| LED | Indication | Explanation |
| :---: | :---: | :---: |
| BUS |  | Operation display |
|  | - green | 24 V supply via bus is available. Module is in operating state. |
|  | green | 24 V supply via bus is missing |
|  | $\bigcirc$ | Bus connection is in INIT mode |
| MNS |  | Module/Net Status |
|  | - green | Module is online with bus, connections for communication have been established |
|  | green | Module is online with bus, connections for communication have not been established |
|  | red | Timeout, module has not been addressed by bus master within the set monitoring time |
|  | - red | Bus error, BUS-OFF state or Rx/Tx-Queue overrun <br> Possible causes: <br> - Wrong baud rate <br> - Bus cable or connector is defect or connected incorrectly <br> - Strong interferences on bus <br> The bus error status can be left by pressing the RUN/STOP switch (transition RUN $\rightarrow$ STOP) if the cause for the error has been eliminated. |
|  | 0 | Module is in INIT mode, possible cause is a missing 24 V power supply through the CAN bus; refer to LED BUS. |

## Switching Matrix

The length of the switching matrix is limited to a maximum of 32 input bytes and 32 output bytes and a maximum of 4 PDOs each for receiving and sending, 8 byte per PDO.

The first word of the input switching matrix and the first word of the output switching matrix each contain a control and/or status word.

The length of the switching matrix can be set by means of DIP switches or configurated by using DevNet.

## Consistency

Based on the protocol characteristics, the transfer data as a whole is consistent. The operating system of the B~IO CL150-DEV module processes the switching matrix coherently in the I/O cycle of the controller. Thus, the consistency also applies to the contents of the switching matrix.

## Electronic Data Sheet EDS

The EDS is an ASCII file specified by the CiA, which describes the objects of a DeviceNet device. This file is available for the B~IO CL150-DEV module and is named RBxxCL15.EDS; $x x$ indicates the release.

The EDS can be read into certain DeviceNet configuration tools, which provides the user with a comfortable configuration solution.

### 9.4.1 Supported DeviceNet Objects

## Identity Object, Class 1

Class and Instance Attributes:

| Object Class <br> [Hex] | Object <br> Instance | Object <br> Attribute | Object Description |
| :--- | :--- | :--- | :--- |
| 1 | 0 | 1 | Revision, revision of the identity object |
| 1 | 1 | 1 | Vendor ID, the vendor ID of Robert Bosch GmbH is 0xFF |
|  | 2 | Product type, 0x07 general purpose discrete I/O |  |
|  | 3 | Product code, 6 |  |
|  | 4 | Revision of CL150-DEV |  |
|  |  | 5 | Status, summed-up device status, bit encoding according to DeviceNet <br> specification |
|  |  | 6 | Serial number |
|  |  | 7 | Product name „CL150-DEV/CL151-DEV DeviceNet Slave" |

Supported Common Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 \times 05$ | Reset |
| $0 \times 0 \mathrm{E}$ | Get Attribute Single |

Comment: Class 1, Instance 1, Attribute 0 for Reset service

## Message Router Object, Class 2

Class and Instance Attributes: No attributes are supported with regard to this object.

Supported Common Services: No services are supported with regard to this object.

## DeviceNet Object, Class 3

Class and Instance Attributes:

| Object Class <br> [Hex] | Object <br> Instance | Object <br> Attribute | Object Description |
| :--- | :--- | :--- | :--- |
| 3 | 0 | 1 | Revision, revision of the DeviceNet Object |
| 3 | 1 | 1 | MAC-ID, MAC-ID of the addressed node |
|  | 2 | Baud rate, ID of the set baud rate |  |
|  | 3 | BOI, support of the Bus Off Interrupt |  |
|  |  | 4 | Bus Off Counter, number of Bus Off events |
|  |  | 5 | Allocation Information, information about the active connections of the <br> Predefined Master/Slave Connection Set |

Supported Common Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 \times 0 \mathrm{E}$ | Get Attribute Single |

Supported Object Specific Services:

| Service Code | Service Name |
| :--- | :--- |
| 0x4B | Allocate Master/Slave Connection Set |
| 0x4C | Release Master/Slave Connection Set |

## Assembly Object, Class 4

Class and Instance Attributes:

| Object Class <br> [Hex] $]$ | Object <br> Instance | Object <br> Attribute | Object Description |
| :--- | :--- | :--- | :--- |
| 4 | 0 | 1 | Revision, revision of DeviceNet Object |
|  |  | 2 | Max Instance, maximum number of instances of this object. |
| 4 | X | 3 | Assembly Object 1, data of the objects to be sent |
| 4 | Y | 3 | Assembly Object 2, data of the objects to be received |

This results in the following object instances:

| Number of Producing <br> Data Bytes | Assembly Object <br> Instance X | Number of Consuming <br> Data Bytes | Assembly Object <br> Instance Y |
| :--- | :--- | :--- | :--- |
| 1 | 4 | 1 | $34(22 \mathrm{hex})$ |
| 2 | 5 | 2 | $35(23 \mathrm{hex})$ |
| 4 | 6 | 4 | $36(24 \mathrm{hex})$ |
| other number | 7 | other number | $37(25 \mathrm{hex})$ |

Supported Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 \times 0 \mathrm{E}$ | Get Attribute Single |
| $0 \times 10$ | Set Attribute Single |

The assembly object is automatically configurated in dependence on the set switching matrix length of the CL150-DEV.

## Connection Object, Class 5

Class and Instance Attributes:

| Object Class [Hex] | Object Instance | Object Attribute | Object Description |
| :---: | :---: | :---: | :---: |
| 5 | 0 | 1 | Revision, revision of the connection object |
| 5 | X | 1 | State, status of the connection |
|  |  | 2 | Instance Type, Type of connection, either I/O or messaging |
|  |  | 3 | TransportClass_trigger, defines the behavior of the connection |
|  |  | 4 | Produced_Connection_ID, Connection ID (CAN Identifier) of the producing connection |
|  |  | 5 | Consumed_Connection_ID, Connection ID (CAN Identifier) of the consuming connection |
|  |  | 6 | Initial_Comm_Characterics, defines the message groups of this connection, producing and consuming |
|  |  | 7 | Produced_Connection_Size, maximum number of bytes that can be sent through this connection |
|  |  | 8 | Consumed_Connection_Size, maximum number of bytes that can be received through this connection |
|  |  | 9 | Expected_Packet_Rate, defines the times for inactivity and watchdog of this connection |
|  |  | 12 | Watchdog_Timeout_action, defines how inactivity and watchdog events are to be treated. |
|  |  | 13 | Produced_Connection_Path_Length, number of bytes in the Produced Connection Path attribute |
|  |  | 14 | Produced_Connection_Path, specifies the application objects whose data is sent through this connection |
|  |  | 15 | Consumed_Connection_Path_Length, number of bytes in the Consumed_Connection_Path attribute |
|  |  | 16 | Consumed_Connection_Path, specifies the application objects whose data is received through this connection |

In the above mentioned table, X is defined as follows:

| $\mathbf{X}$ | Type of Connection |
| :--- | :--- |
| 1 | Explicit Messaging Connection |
| 2 | Poll I/O Connection |
| 3 | Bit Strobe I/O Connection |
| 4 | COS/Cyclic I/O Connection |
| 5 | Reserved |

Supported Class Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 \times 08$ | Create |

Supported Common Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 \times 0 \mathrm{D}$ | Apply Attributes |
| $0 \times 0 \mathrm{E}$ | Get Attribute Single |
| $0 \times 10$ | Set Attribute Single |

Discrete Input Point, Class 8
Class and Instance Attributes:

| Object Class <br> $[\mathrm{Hex}]$ | Object <br> Instance | Object <br> Attribute | Object Description |
| :--- | :--- | :--- | :--- |
| 8 | 0 | 1 | Revision, revision of DeviceNet object |
|  | 2 | Max Instance, maximum number of instances of this object |  |

The value of the „Max Instance" attribute represents the number of input points. This value is always a multiple of 8.

Supported Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 \times 0 \mathrm{E}$ | Get Attribute Single |

## Discrete Output Point, Class 9

Class and Instance Attributes:

| Object Class <br> [Hex] | Object <br> Instance | Object <br> Attribute | Object Description |
| :--- | :--- | :--- | :--- |
| 9 | 0 | 1 | Revision, revision of DeviceNet object |
|  | 2 | Max Instance, maximum number of instances of this object |  |

The value of the „Max Instance" attribute represents the number of output points. This value is always a multiple of 8 .

Supported Services:

| Service Code | Service Name |
| :--- | :--- |
| OxOE | Get Attribute Single |

### 9.4.2 Vendor-Specific Objects

I/O Data Object, Class 100
Class and Instance Attributes:

| Object Class [Hex] | Object Instance | Object Attribute | Object Description |
| :---: | :---: | :---: | :---: |
| 100 | 0 | 1 | Revision, revision of I/O data objects |
|  |  | 2 | Max Instance, maximum number of instances of the I/O data object |
| 100 | 1 | 100 | Number Of Inputs, number of input bytes |
|  |  | 101 | Number of Outputs, number of output bytes |
|  |  | 102 | Input Data, input data as entire stream |
|  |  | 103 | Output Data, output data as entire stream |
| 100 | 2 | $100+\mathrm{i}$ | Input Data (Byte), input data as single byte <br> $\mathrm{i}=0$, Byte 0 of input data <br> $i=1$, Byte 1 of input data etc. |
| 100 | 3 | $100+i$ | Output Data (Byte), output data as single byte $i=0$, Byte 0 of output data $i=1$, Byte 1 of output data etc. |
| 100 | 4 | $100+\mathrm{i}$ | Input Data (Word), input data as single word $i=0$, Word 0 of input data $i=1$, Word 1 of input data etc. |
| 100 | 5 | 100 + i | Output Data (Word), output data as single word <br> $\mathrm{i}=0$, Word 0 of output data <br> $\mathrm{i}=1$, Word 1 of output data <br> etc. |

Supported Common Services:

| Service Code | Service Name |
| :--- | :--- |
| 0x0E | Get Attribute Single |
| $0 \times 10$ | Set Attribute Single |

Status Object, Class 101
Class and Instance Attributes:

| Object Class <br> [Hex] | Object <br> Instance | Object <br> Attribute | Object Description |
| :--- | :--- | :--- | :--- |
| 101 | 0 | 1 | Revision, revision of status and diagnostic objects |
|  | 2 | Max Instance, maximum number of instances of the status and <br> diagnostic object |  |
| 101 | 1 | 100 | Manufacturer Status Register, status of the CL150-DN system |
|  | 101 | Module Serial Number, individual serial number of the module |  |
| 101 | 2 | 100 | Diagnostic Data Length |
|  | 101 | Diagnostic Status |  |

Supported Common Services:

| Service Code | Service Name |
| :--- | :--- |
| $0 x 0 \mathrm{E}$ | Get Attribute Single |

### 9.5 Interbus-S Interface

| Type | RS485 |
| :--- | :--- |
| Electrical isolation | yes |
| Baud rate | 500 kbaud |
| Connector | 9-pin socket connector D-SUB IN <br>  |

## Connection

The B~IO CL150-IBS module is additionally provided with a fieldbus connection for the 2-wire long-distance bus of the Interbus-S. The Interbus-S is connected through a 9-pin D-SUB socket which is screwed to the D-SUB connector IN X72 of the CL150-IBS. An additional IBS component is to be connected to the OUT-X71 interface.

The connection assignment corresponds to the Interbus-S D-SUB assignment of Phoenix Contact.

| Pin No. | Signal <br> IN X72 | Signal <br> OUT X71 | Explanation |
| :--- | :--- | :--- | :--- |
| 1 | DO | DO | Transmitted data |
| 2 | DI | DI | Received data |
| 3 | COM | COM | Zero V reference potential |
| 4 |  |  | Free |
| 5 |  | +5 V _ISO | For bridge RBST |
| 6 | /DO | IDO | Transmitted data |
| 7 | /DI | /DI | Received data |
| 8 |  |  | Free |
| 9 |  | RBST | Identifier, further stations are connected |

When implementing a connection cable, the bridge from pin 5 to pin 9 must be available in the OUT bus cable connector.

If not mentioned otherwise, please comply with the installation guidelines and the cabling recommendations for the Interbus-S by Phoenix Contact, e.g. IBS SIG Part 1 UM or Installation Manual IBS SYS INST UM.

## Displays

The operating states of the Interbus connection are indicated by 3 busspecific LEDs:

| Name | Color | Function |
| :--- | :--- | :--- |
| RC | green | The incoming long-distance bus is properly <br> connected and Bus Reset of the Busmaster is <br> inactive. |
| BA | green | Messages are transferred to the bus |
| RD | red | The forwarding long-distance bus is switched off. |

The UL operation display of the B~IO CL150-IBS is different from the UL of all other CL150 versions with regard to one detail: the continuous green light means „Supply voltage o.k.". It does not give any information about the processor's availability for operation.

Battery faults and low battery warning are not indicated by a flashing green but a flashing orange light.

The CL150-IBS bus connection is provided with an 8 -fold SMD switch.
87654321
IIinin
ON
Ex works, all switches are set to OFF.
The switches comprise the following functions:

| Switch | Status | Function |
| :---: | :---: | :---: |
| 1 | OFF | Free |
|  | ON |  |
| 2 | OFF | Data width switching matrix |
|  | ON |  |
| 3 | OFF |  |
|  | ON |  |
| 4 | OFF |  |
|  | ON |  |
| 5 | OFF | High and low byte swap, corresponds to Bosch's representation |
|  | ON | No high and low byte swap, corresponds e.g. to Siemens‘ representation |
| 6 | OFF | Free |
|  | ON |  |
| 7 | OFF | Diagnosis message at busmaster |
|  | ON | No diagnosis message at busmaster |
| 8 | OFF | Free |
|  | ON |  |

The settings of the switch are read in only once after having switched on the 24 V power supply.

## Switches 2, 3, and 4:

With these switches, the data width of the switching matrix, with which the decentralized CL150-IBS logs into the central busmaster, is set.

| SW4 | SW3 | SW2 | Data Width Switching Matrix |
| :---: | :---: | :---: | :--- |
| 0 | 0 | 0 | 2 byte in- and output data |
| 0 | 0 | 1 | 4 byte in- and output data |
| 0 | 1 | 0 | 6 byte in- and output data |
| 0 | 1 | 1 | 8 byte in- and output data |

## Switch 5:

In contrast to the Bosch connection, other busmaster connections (Siemens, AEG, etc.) have their low and high byte switched. If necessary, this can be adjusted centrally by means of addressing and decentrally by using the switch.

The switch's setting to OFF corresponds to the Bosch representation.

## Switch 7:

This switch is used for determining whether diagnosis messages should be sent to the busmaster or not.

## Startup Characteristics

The CL150-IBS establishes the data width of the switching matrix on the basis of the DIP switch S3's position and sends it to the busmaster.

ID
Because the CL150-IBS always occupies a symmetrical in- and output field, it is provided with 03 H , the general identification code for digital inand output long-distance bus stations.

## Cyclical exchange of user data

In the cyclical exchange of the user data, the CL150-IBS bus connection is faultlessly parameterized and configurated. The in- and output data of the switching matrix is cyclically transferred between the PLC and the CL150-IBS through the Interbus-S.

## Consistency

Because of the characteristics of the bus, the transfer data as a whole is consistent. The operating system of the B~IO CL150-IBS module processes the switching matrix coherently in the I/O cycle of the controller. Thus, the consistency also applies to the contents of the switching matrix.

## 10 Appendix

### 10.1 Accessories

| Designation | Order No. |
| :--- | :--- |
| Backup battery for CL150/151/150A/151A | 1070081777 |
| Programming unit cable K19, COM interface/ CL150 | 1070077753 |
| Socket connector set for CL150, CL150-DP, CL151-DP, |  |
| CL150-CAN, CL151-CAN, CL150-IBS, CL151-IBS, |  |
| CL150-DEV, CL151-DEV | 1070080342 |
| - Screw terminals | 1070080349 |
| - Spring clamp terminals | 1070080363 |
| - Top screw terminals | 1070081805 |
| Socket connector set for CL151 | 1070081804 |
| - Screw terminals | 1070081806 |
| - Spring clamp terminals | 1070081801 |
| - Top screw terminals | 1070081800 |
| Socket connector set for CL150A, CL151A | 1070081802 |
| - Screw terminals | 1070080157 |
| - Spring clamp terminals | 1070080155 |
| - Top screw terminals | Terminal blocks for CL150 |

## Modular Extension

| Designation | Order No. |
| :--- | :--- |
| Module connector | 1070079782 |
| 8DI, digital input module, 8 inputs, 24 V | 1070079757 |
| 16DI, digital input module, 16 inputs, 24 V | 1070080144 |
| 16DI-3, digital input module, 16 inputs, 3-wire connection, 24 V | 1070081862 |
| 8DO, digital output module, 8 outputs, 24 V, 0.5 A | 1070079759 |
| 8DO/2A, digital output module, 8 outputs, 24 V, 2 A | 1070080151 |
| 16DO, digital output module, 16 outputs, 24 V, 0.5 A | 1070081858 |
| 8DI/DO, digital combination module, 8 inputs or outputs, 0.5 A | 1070080709 |
| 8DO R, output module, 8 outputs, relay | 1070080680 |
| 4AI_UI, analog input module, 4 voltage and current inputs | 1070080524 |
| 4AI_UIT, analog input module, 4 voltage, current and <br> thermoelement inputs | 1070080526 |
| 4AO_I, analog output module, 4 current outputs | 1070080528 |
| 4AO_U, analog output module, 4 voltage outputs | 1070080530 |
| I/O gateway, for coupling of two fieldbus systems | 1070083150 |

For additional accessories for the fieldbus systems and B~IO devices, please refer to the Installation Engineering catalogue, order no. 1070 072190.

### 10.2 Abbreviations

| Abbreviations | Explanation |
| :--- | :--- |
| EEM | Electrostatically Endangered Modules <br> ESD <br>  <br> ElectroStatic Discharge <br> abbreviation for all terms that concern <br> electrostatic discharges, e.g. ESD <br> protection, ESD danger |
| RTC | Real Time Clock |
| DDBF | Device Data Base File <br> file that describes the characteristics of <br> a device with regard to a PROFIBUS- <br> DP connection |
| EDS | Electronic Data Sheet <br> file that describes the characteristics of <br> a device with regard to a CANbus <br> and/or DeviceNet connection |
| CAN | Controller Area Network <br> fieldbus as per ISO11898 |
| DP | PROFIBUS-DP <br> fieldbus as per EN50170-2 |
| DEV | Device Net <br> fieldbus according to the requirements <br> and guidelines of Open DeviceNet <br> Association Inc. (ODVA) |
|  | Interbus-S <br> fieldbus as per DIN 19258 |
|  |  |
