## **JUMO** IMAGO F3000 Process controllers for the meat processing industry

## **Brief description**

These process controllers are built to a modular design, and are suitable for the control and regulation of cooking, smoking and climate-control installations, and all associated equipment such as smoke generators, catalyzers etc. They are available in both upright (portrait) and horizontal (landscape) formats.

The unit has a 5" color display capable of showing 27 colors. Templates for the user interface can be individually adjusted and laid out by the users themselves. Texts, process values, background diagrams and icons can be arranged as required. A status line indicates the last alarm that occured. LED displays have also been included, so that the most important process variables are visible from a distance. Individual keys can be assigned to special functions and labelled accordingly.

The instrument can store up to 99 named profile programs of up to 99 segments. All the processes required in the system are defined in 99 process steps and then simply called up sequentially for the program entry. An optional Plug & Play memory is available that can store all the data from the instrument, thus enabling easy exchange of hardware without any problems caused by lost data. The "Teleservice" software makes is possible to carry out configuration from a remote location, via a modern and the telephone network, thus saving on-site service costs.

A communication interface for MODbus or Profibus-DP facilitates integrating the instrument into a network.

Type 700101/1...

## **Block structure**

## **Key features**

- Two screen layout templates (masks) for automatic operation and one for the basic status, all freely editable
- 5" color display, 12mm LED displays for process values
- Plug & Play memory, to back up configuration data, transfer programs from one instrument to another, and to read in instrument software
- Configuration and parameter levels in English, German, French
- Math and logic functions
- Teleservice via modem
- Setup program for Windows 95/98/NT4.0/2000/ME
- Program editor

#### Display and control elements

### **Programs**

99 profile programs can be entered, stored, and changed at any time. They are made up of various process steps with the associated setpoint values. A program can have a maximum of 99 segments. A total of 3000 segments can be stored for all programs together. The programs are chosen from a list or selected by meaningful icons.

#### **Segments**

A segment consists of a process step, up to 9 setpoint values, and the segment time. Various conditions for moving to the next step control the segment sequence.

#### **Process steps**

A process step contains various pre-defined systems states for smoking, reddening etc., which are usually specified by the system manufacturer.

The user only has to select the process and enter the appropriate setpoints. Up to 99 process steps can be stored.

#### Step-on conditions

The system steps on to the next segments when...

- ... the segment time has elapsed
- ... the programmed core temperature has been reached
- ... the segment time has elapsed and/or the programmed core temperature has been reached.
- ... the programmed final F value has been reached.
- ... the programmed final C value has been reached.
- ... a logic input that was configured as a condition for stepping on has been activated.
- ... the programmed final F value and the programmed core temperature have been reached.

#### Cooking process

The process can be controlled by the delta cooking or F-value cooking methods.

#### Signal for end of program

This is provided by a relay output.

#### Operating functions

18 of the total of 36 operating outputs can have a switching response assigned. They can be configured for ON-advance, OFF-advance, ON-delay or OFF-delay with respect to the changeover point from one segment to another. A pulse/pause ratio can also be selected. All times can be set individually.

#### 2 timers

After entering an operating time for the system, a counter runs and the system has to be enabled by a password. A second counter can, for instance, be used to monitor and signal cleaning intervals.

## Math and logic functions

The math module makes it possible to include setpoints, output levels, analog input measurements and the like in a mathematical formula.

The logic module can be used to create a logical combination of such variables as logic inputs, limit comparators and operating outputs.

A maximum of 4 math functions and 8 logic combinations can be entered via the setup program, and the results of these functions can be delivered at the outputs or used internally.

All logic formulae are processed and become effective within 100ms.

## **Self-optimization**

Standard features include self-optimization, making it possible for a user to adapt the controller to match the control loop without any knowledge of control systems engineering.

This feature tests and evaluates the response of the control loop to specific changes in the control input parameters. The control parameters Xp, Tn, Tv and Cy are calculated.

## **PC** programs

#### ■ Setup program

The setup program for configuring the instrument can be installed in English, German or French. A PC can be used to create sets of data, edit them, transfer them to the process controls, or read them out from the instrument. The sets of data are stored and managed. 3 process layouts can be freely configured.

#### ■ Teleservice

- Remote configuration and diagnosis of the system via modem
- Establish a connection through the setup program, dialling by:
  a) direct-dialling through the setup, or
  - a) direct-dialling through the setup, of b) callback
- Display system status, such as operating modes, logic inputs and outputs, alarms and system information.

#### ■ Process steps

Process steps are defined through the setup program and transferred to the instrument. The program editor is used to compile the programs.

# RS422/RS485 interface (option)

The serial interface is used for communication with higher-level (supervisory) systems, and includes electrical isolation.

The transmission protocols used are MODbus and Profibus.

# Plug & Play memory (option)

This is plugged into the back of the instrument, and can store all the instrument data, or a selection:

- parameter and configuration data
- process steps
- user programs
- instrument software version

Practical applications are for:

- simple configuration after a hardware replacement
- reading in new setup data from the system manufacturer
- copying user programs
- reading in new applications programs from the manufacturer
- reading in new instrument software

## Interfaces for teleservice, setup and visualization

## **Extract from the parameter level**

#### **Electrical isolation**

## **Technical data**

Analog inputs (max. two I/O modules, each with 4 inputs)

| Thermocouple  | s        | Range           | Meas. accuracy | Ambient temperature error |
