

Altivar™ 312 variable speed drives

For 3-phase motors from 0.25 hp (0.18 kW) to 20 hp (15 kW)

Catalog
2011

■ Brochure	4
■ Catalog	13

Altivar™ 312 drives:

Designed for high performance and compatible with the control system architectures of your machines

Enhanced communication:

- CANopen™ Daisy Chain, DeviceNet™, Profibus™ DP

Simplified user interface:

- Setup via mobile phone (Bluetooth®)
- Intuitive navigation
- Local control on the front panel

Numerous application-specific functions

Auto-tuning for maximum performance

Integrated EMC filter

Rugged for use in all environments

Increased performance for industrial machines

- Materials handling and packaging
- Packing
- Textile machines
- Special machines
- Pumps and fans

Up to 30 % increase in performance

compared to the market average

1TB-2

Unique functionality for every type of machine application

Materials handling

- +/- speed
- Brake sequence
- Motor switching
- Management of limit switches
- Switching frequency up to 16 kHz
- Current limitation
- Linear ramps, S, U or customized
- Second ramp

Packaging and packing

- Brake sequence
- Output contactor control
- Accessible DC bus

Special machines

- Current limitation
- Catch on-the-fly
- Controlled stop on loss of line supply
- Derated operation

Textiles

- 16 preset speeds
- +/-10 V bipolar input reference
- PI regulator

Pumps, ventilation

- PI regulator and reference, automatic/manual
- Automatic restart
- Stop modes in the event of a fault
- Limitation of low speed operating time
- Detection of current, torque and thermal state thresholds of drive and motor

Other options

- Protection of machine by locking parameters
- Multiple assignment of logic inputs
- Saving a set of parameters
- Management of external faults
- Display of parameters: current, power, torque, speed, frequency, etc.

50 application-specific functions listed in this catalog

Simplicity in operation... Boosts performance of your machines

Local control on the front panel

Ergonomically designed
button for simple navigation

Run/Stop commands
on the device

Snap-lock seal

Universal communication tools and networks
for your control system architectures via
the RJ45 port.

Increased productivity

- Reduced design and installation costs thanks to the SoMove™ software workshop
- Auto-tuning saves setup time and optimizes performance
- Full mechanical and software compatibility with the Altivar™ 31 in event of replacement
- The compact size means smaller enclosures (integrated EMC filter and side-by-side mounting without derating)

Remote HMI terminals

- Same as Altivar™ 61 and 71 terminals
- Plain text in your language

- Same as Altivar™ 12 terminals
- LED display

Optimize communication with your control system architectures

One connection, one software tool to program the PLC and configure the drives

Altivar™ 312 drives integrate transparently into your architectures and communicate with most control system products:

- Modbus™ and CANopen™ are integrated as standard
- Option cards: CANopen Daisy Chain, DeviceNet™, Profibus™ DP
- Gateways for Ethernet/Modbus and Fipio™/Modbus

A comprehensive product range with universal product references:

Altivar™ 312 drives function all over the world.

User-friendly set-up and configuration

A common platform

Duplicate the configuration using the many common tools available for Altivar™ and Lexium™ series 2 drives: Simple Loader, Multi-Loader, graphic interface, SoMove™ software workshop, Bluetooth interface and mobile phone software.

Preparation of files

The SoMove software workshop enables the design office to prepare the files for drive configuration. 2 methods for loading the configuration:

- Direct from PC to drive using a USB/RJ45 cable
- Without a PC, via an SD memory card using Multi-Loader

Equipment testing

The SoMove software workshop serves as a dynamic debugging tool for your machine. The oscilloscope function is extremely useful when making adjustments.

Multi-Loader configuration tool

The configurations of several drives are stored on a standard SD memory card. Simply load it directly into your PC or insert into the Multi-Loader, which can be used as a card reader.

Simple Loader duplication tool

Copy the settings from a configured drive and duplicate on all your machines.

SoMove
Software workshop

Save Time

when setting up the device: using Multi-Loader, you can select and transfer the required file in a matter of seconds.

Use your mobile to configure your Altivar™ 312 drive

Efficiency

with an all-in-one solution

- Download and transfer configurations
- Drive adjustment and maintenance
- Send and receive configuration files locally or remotely in a matter of seconds

Safety

and confidentiality

- Monitor and adjust your machine from a secure location
- Bypass the usual physical and security constraints to access your machines via the Bluetooth wireless connection. There's no need to open the enclosure!
- Save changes or reinstall saved configurations whenever you want

Simplicity

and comfort

- Work in comfort using Bluetooth wireless communication
Take advantage of the user-friendly SoMove™ Mobile dialog functions
- Always know which menu you are in
- Share configuration files via MMS or email

Altivar™ Innovation

Remote configuration to update settings by mobile or PC via Bluetooth.

A wide range of products meeting international standards

Outstanding performance

- All the advantages of Altivar™ 31 drives
- Excellent resistance to harsh environments (50°)
- Coated cards as standard (IEC 60721-3-3 Classes 3C2 and 3S2)
- Excellent resistance to power supply and motor interference

Large voltage range

- Single-phase 200 to 240 V with an integrated C2 EMC filter and optional C1 filter
- Three-phase 200 to 240 V
- Three-phase 380 to 500 V with integrated C2 EMC filter
- Three-phase 525 to 600 V

Compliance with specific requirements

- Integrated Class 2 EMC filter for radiated and conducted emissions
- Local control integrated in the drive (programmable)
- Positive and negative logic
- DIN rail mounting
- UL Type 1 kit

Standards and certifications

EC/EN 61800-5-1, IEC/EN 61800-3 (environments 1 and 2, C1 to C3), CE, UL, CSA, C-Tick, NOM, GOST

Altivar™ 71 variable speed drives

See more technical information online at www.schneider-electric.com

Altivar™ 312 variable speed drives

Introduction

The Altivar™ 312 drive is a frequency inverter for 200 to 600 V three-phase asynchronous motors from 0.18 to 15 kW.

The Altivar 312 drive is robust, compact and easy to install. Its integrated functions are particularly suitable for the requirements of applications involving simple industrial machines.

By taking into account product setup and use, starting at the design stage, we are able to offer a reliable, cost-effective solution to manufacturers of simple machines and installers.

With its various communication cards that are available as options, the Altivar 312 drive integrates perfectly in the main control system architectures.

Examples of solutions provided:

- Numerous options for loading, editing and saving drive configurations using various tools, such as the SoMove™ setup software, the SoMove Mobile software for mobile phones, remote display terminals and the Simple Loader and Multi-Loader configuration tools.
- Adaptation to industrial communication buses and networks by simply replacing the drive control I/O card with one of the communication cards
- User interface identical to the Altivar 12 range of variable speed drives, making setup easy, and enabling those using it to adapt quickly.

Applications

The Altivar 312 drive incorporates functions that are suitable for the most common applications, including:

- Material handling (small conveyors, hoists, etc.)
- Packing and packaging machines (small bagging machines, labeling machines, etc.)
- Special machines (mixers, kneaders, textile machines, etc.)
- Pumps, compressors, fans

Functions

The Altivar 312 drive has six logic inputs, three analog inputs, one logic/analog output and two relay outputs.

The main functions available are as follows:

- Motor and drive protection
- Linear, S, U or customized acceleration and deceleration ramps
- Local control of the speed reference using the navigation button
- +/- speed
- 16 preset speeds
- PI regulator and references
- 2-wire/3-wire control
- Brake sequence
- Automatic catching a spinning load with speed detection and automatic restart
- Fault configuration and stop type configuration
- Saving the configuration in the drive

Several functions can be assigned to one logic input.

Comprehensive product offering

The Altivar 312 range of variable speed drives covers motor power ratings from 0.18 kW to 15 kW with four types of power supply:

- 200 V to 240 V single-phase, 0.18 kW to 2.2 kW (ATV 312H●●●M2)
- 200 V to 240 V three-phase, 0.18 kW to 15 kW (ATV 312H●●●M3)
- 380 V to 500 V three-phase, 0.37 kW to 15 kW (ATV 312H●●●N4)
- 525 V to 600 V three-phase, 0.75 kW to 15 kW (ATV 312H●●●S6)

Several drives can be mounted side by side to save space.

The Altivar 312 drive integrates the Modbus and CANopen communication protocols as standard. The protocols can be accessed via the RJ45 connector on the underside of the drive.

In addition to the Modbus and CANopen™ protocols that can be accessed as standard, the Altivar 312 drive can be connected to the main industrial communication buses and networks by replacing the drive's control I/O card with one of the communication cards that are available as options: CANopen Daisy chain, DeviceNet™ and Profibus™ DP. The Modbus TCP network and the Fipio™ bus are also accessible via dedicated gateways.

Comprehensive product offering (continued)

The entire range complies with international standards IEC 61800-5-1, IEC 61800-2 and IEC 61800-3, and UL, CSA, C-Tick, NOM and GOST certifications. It has been developed to meet the requirements of environmental directives (RoHS) and those of the European Directives to obtain the CE mark.

EMC electromagnetic compatibility

The incorporation of EMC filters in **ATV 312H●●●M2** and **ATV 312H●●●N4** drives and compliance with EMC requirements simplify installation and provide a very economical means of ensuring devices meet the criteria to receive the CE mark. This filter can be disconnected via a jumper or a moveable wire with tag. The **ATV 312H●●●M3** and **ATV 312H●●●S6** drives are designed without an EMC filter.

Filters are available as an option and can be installed by the customer to reduce the emission levels of **ATV 312H●●●M2**, **ATV 312H●●●M3** and **ATV 312H●●●N4** drives. See page 46.

External accessories and options

External accessories and options can be used with Altivar™ 312 drives:

- UL Type 1 conformity kits, plates for direct mounting on 35 mm DIN rails, etc.
- Braking resistors, line chokes, additional EMC input filters, output filters, etc.

Dialog and configuration tools

Human-Machine interface

The 4-digit display **1** displays drive states, faults and parameter values.

The navigation button **2** is used to navigate through the menus, modify values and change the motor speed in local mode.

The RUN and STOP/RESET keys **3** are used to control motor starting and stopping in local mode. These two keys can be made accessible on the front panel by removing the cover **4** from the door.

HMI terminals

The Altivar 312 drive can be connected to a remote display terminal or a remote graphic display terminal, which are available as options.

The remote display terminal can be mounted on an enclosure door with IP 54 or IP 65 degree of protection. It provides access to the same functions as the Human-Machine interface.

The remote graphic display terminal, with its “full text” display in the user's language, provides a user-friendly interface for configuration, debugging or maintenance. See page 36.

SoMove setup software

The SoMove™ setup software is used to configure, adjust and debug the Altivar 312 drive with the Oscilloscope function, and also for maintenance of this drive, like all other Schneider Electric drives and starters.

It can be used with a direct connection or a Bluetooth® wireless connection. See page 37.

SoMove Mobile software for mobile phones

The SoMove Mobile software is used to edit the drive parameters from a mobile phone via a Bluetooth® wireless connection.

It can also be used to save configurations. These configurations can be imported or exported from a PC via a Bluetooth® wireless connection.

See page 37.

Simple Loader and Multi-Loader tools

The Simple Loader tool enables one powered-up drive's configuration to be duplicated on another powered-up drive.

The Multi-Loader tool enables configurations to be copied from a PC or a powered-up drive and duplicated on another powered-up drive.

See page 37.

Environmental specifications			
Conformity to standards			Altivar™ 312 drives have been developed to conform to the strictest international standards and the recommendations relating to electrical industrial control devices (IEC), in particular: IEC 61800-5-1 (low voltage), IEC 61800-3 (EMC immunity and conducted and radiated EMC emissions).
EMC immunity			IEC 61800-3, Environments 1 and 2 (EMC requirement and specific test methods) IEC 61000-4-2 level 3 (electrostatic discharge immunity test) IEC 61000-4-3 level 3 (radio-frequency radiated electromagnetic field immunity test) IEC 61000-4-4 level 4 (electrical fast transient/burst immunity test) IEC 61000-4-5 level 3 (surge immunity test)

CE marking			The drives are marked CE in accordance with the European low voltage (2006/95/EC) and EMC (2004/108/EC) directives
Product certification			UL, CSA, NOM, GOST, C-Tick and DNV
Degree of protection			IP 31 and IP 41 on upper part and IP 21 on connection terminals
Vibration resistance	Drive not mounted on DIN rail		Conforming to IEC 60068-2-6: 1.5 mm peak to peak from 3 to 13 Hz, 1 gn from 13 to 150 Hz
Shock resistance			15 gn for 11 ms conforming to IEC 60068-2-27
Maximum ambient pollution Definition of insulation			Degree 2 conforming to IEC 61800-5-1
Environmental conditions Use			IEC 60721-3-3 classes 3C2 and 3S2
Relative humidity		%	5 to 95 non-condensing, no dripping water, conforming to IEC 60068-2-3
Ambient air temperature around the device	Operation	°C	- 10 to + 50 without derating - 10 to + 60 with derating removing the protective cover on top of the drive (see derating curves, page 58)
	Storage	°C	- 25 to + 70
Maximum operating altitude	ATV 312H●●●●●	m	1000 without derating
	ATV 312H●●●●M2	m	Up to 2000 for single-phase supplies and corner grounded distribution networks, derating the current by 1% for each additional 100 m
	ATV 312H●●●●M3 ATV 312H●●●●N4 ATV 312H●●●●S6	m	Up to 3000 metres for three-phase supplies, derating the current by 1% for each additional 100 m
Operating position Maximum permanent angle in relation to the normal vertical mounting position			

(1) See table on page 47 to check the permitted cable lengths.

Drive specifications																		
Output frequency range		Hz	0 to 500															
Switching frequency		kHz	Nominal switching frequency: 4 kHz without derating in continuous operation. Adjustable during operation from 2 to 16 kHz Above 4 kHz, derate the nominal drive current. The nominal motor current should not exceed this value. See derating curves on page 58

Communication port specifications

Available protocols		Modbus™ and CANopen™ protocols integrated in the drive. Both these protocols can be accessed via a single RJ45 connector on the underside of the drive.
Modbus protocol		
Structure	Connector	RJ45
	Physical interface	RS 485
	Transmission mode	RTU
	Transmission speed	Configurable via the Human-Machine interface, remote display terminals or SoMove™ setup software: 4800, 9600 or 19200 bps
	Number of subscribers	31
	Address	1 to 247, configurable via the Human-Machine interface, remote display terminals or SoMove setup software
Services	Functional profiles	CiA 402
	Messaging	Read Holding Registers (03) Write Single Register (06) Write Multiple Registers (16) Read Device Identification (43)
	Communication monitoring	Configurable
CANopen protocol		
Structure	Connector	RJ45
	Network management	Slave
	Transmission speed	Configurable via the Human-Machine interface, remote display terminals or SoMove setup software: 10, 20, 50, 125, 250, 500 kbps or 1 Mbps
	Number of subscribers	127
	Address (Node ID)	1 to 127, configurable via the Human-Machine interface, remote display terminals or SoMove setup software
Services	Number of PDOs (Process Data Objects)	2 PDOs: ■ PDO 1: cannot be configured ■ PDO 6: can be configured
	PDO modes	PDO 1: asynchronous PDO 6: asynchronous, Sync, cyclic asynchronous
	Number of SDOs (Service Data Objects)	1 receive SDO and 1 transmit SDO
	Functional profiles	CiA 402
	Communication monitoring	Node guarding and Heartbeat, Boot-up messages, Emergency messages, Sync and NMT
Diagnostics	Using LEDs	On Human-Machine interface
Description file		An eds file is available on our website www.schneider-electric.com or the "Description of the Motion & Drives offer" DVD-ROM

Torque specifications (typical curves)

The curves opposite define the available continuous torque and transient overtorque for both force-cooled and self-cooled motors. The only difference is in the ability of the motor to provide a high continuous torque at less than half the nominal speed.

- 1 Self-cooled motor: continuous useful torque (1)
- 2 Force-cooled motor: continuous useful torque
- 3 Transient overtorque for 60 s
- 4 Transient overtorque for 2 s
- 5 Torque in overspeed at constant power (2)

Special uses

Use with a motor with a different power rating to that of the drive

The device can power any motor which has a lower rating than that for which the drive was designed. For motor ratings slightly higher than that of the drive, check that the current taken does not exceed the continuous output current of the drive.

Testing on a low power motor or without a motor

In a testing or maintenance environment the drive can be checked without having to switch to a motor with the same rating as the drive (particularly useful in the case of high power drives). This use requires deactivation of motor phase loss detection.

Use of motors in parallel

The drive rating must be greater than or equal to the sum of the currents and powers of the motors to be controlled.

In this case, it is necessary to provide external thermal protection for each motor using probes or thermal overload relays.

If three or more motors are connected in parallel, it is advisable to install a motor choke between the drive and the motors. See page 48.

Motor switching at the drive output

Switching can be carried out with the drive locked or unlocked. In the case of switching on-the-fly (drive unlocked), the motor is controlled and accelerated until it reaches the reference speed smoothly following the acceleration ramp.

This use requires configuration of automatic catching a spinning load ("catch on the fly") and activation of the function which manages the presence of an output contactor.

Note: Depending on the drive rating, downstream ferrite suppressors may be required between the drive and the output contactor (see page 48).

Typical applications: loss of safety circuit at drive output, bypass function, switching of motors connected in parallel.

Recommendations for use: synchronize control of the output contactor with that of a freewheel stop request from the drive on a logic input.

KM1: contactor

t1: KM1 opening time (motor freewheeling)

t2: acceleration with ramp

N: speed

Example of loss of output contactor

(1) For power ratings ≤ 250 W, less derating is required (20% instead of 50% at very low frequencies).

(2) The nominal motor frequency and the maximum output frequency can be adjusted from 40 to 500 Hz. The mechanical overspeed specifications of the selected motor must be checked with the manufacturer.

(1) These values are given for a nominal switching frequency of 4 kHz, for use in continuous operation. The switching frequency is adjustable from 2 to 16 kHz. Above 4 kHz, derate the nominal drive current. The nominal motor current should not exceed this value. See derating curves on page 58.
 (2) Typical value for a 4-pole motor and a maximum switching frequency of 4 kHz, with no line choke for max. prospective line Isc (4).
 (3) Nominal supply voltage, min. U1, max. U2: 200 (U1) to 240 V (U2), 380 (U1) to 500 V (U2), 525 (U1) to 600 V (U2).
 (4) If line Isc is greater than the values in the table, add line chokes (see page 45).
 (5) Drives supplied with category C2 or C3 integrated EMC filter. This filter can be disconnected.
 (6) If a communication card is used, it takes the place of the control I/O card. To reduce installation costs, the drive can be ordered without a control I/O card. To do this, simply add a B at the end of the reference. For example: ATV 312H075N4 becomes ATV 312H075N4B. The communication card must be ordered separately (see page 30).
 (7) EMC filter available as an option (see page 47).
 (8) Mandatory line choke to be ordered separately (see page 45).

Altivar™ 312 variable speed drives

Communication buses and networks

Example of configuration on Modbus serial link

Example of configuration on CANopen machine bus

Example of installation of a communication card (1)

Introduction

The Altivar™ 312 drive is designed to meet the configuration requirements found in the main industrial communication installations.

It includes the Modbus™ and CANopen™ communication protocols as standard. It can also be connected to other industrial communication buses and networks using one of the communication cards or modules that are available as options.

Standard configuration

The Altivar 312 drive is equipped with a control I/O card **1** which integrates:

- I/O terminals, comprising:
 - Six logic inputs: LI1 to LI6
 - Three analog inputs: AI1 to AI3
 - Two analog outputs: AOV and AOC (2)
 - Two relay outputs: R1 and R2
- A Modbus/CANopen communication port, that is accessed on an RJ45 connector

The Modbus/CANopen communication port is specifically for controlling the drive via a PLC or another type of controller.

It is also used for connecting dialog and configuration tools:

- Remote display terminal
- Remote graphic display terminal
- SoMove™ setup software
- SoMove Mobile software for mobile phones
- Simple Loader and Multi-Loader configuration tools

Communication cards for industrial applications

Several communication cards for industrial applications **2** are available as options. These cards are used in place of the drive's control I/O card **1** (1)

The following communication cards are available:

- CANopen Daisy chain card (optimized solution for daisy chain connection to CANopen machine bus, see page 34)
- DeviceNet™ card
- Profibus™ DP card

Communication modules

The Altivar 312 drive can be connected to other communication buses and networks via modules that are available as options:

- Modbus TCP network via the Ethernet/Modbus bridge
- Fipio™ bus via the Fipio/Modbus gateway

(1) To reduce installation costs when replacing the control I/O card **1** with a communication card **2**, ATV 312H●●●M2 and ATV 312H●●●N4 drives can be ordered without a control I/O card. See page 28.

(2) These two outputs cannot be used at the same time.

Functions

All the functions of the Altivar™ 312 drive can be accessed via the communication buses and networks:

- Control
- Monitoring
- Adjustment
- Configuration

The speed control and reference may come from different control sources:

- Logic input or analog I/O terminals
- Communication bus or network
- Remote display terminal

The advanced functions of the Altivar 312 drive can be used to manage switching of these control sources according to the requirements of the application.

The assignment of the communication periodic I/O data can be selected using the network configuration software.

The Altivar 312 drive is controlled using the CiA 402 native profile.

Communication is monitored according to criteria specific to each protocol.

Regardless of protocol type, the reaction of the drive to a communication fault can be configured as follows:

- Freewheel stop, stop on ramp, fast stop or braked stop
- Maintain the last command received
- Fallback position at a predefined speed
- Ignore the fault

Specifications of the CANopen™ Daisy chain card VW3 A312 08 (1)

Structure	Connector	4 connectors: <ul style="list-style-type: none"> ■ 1 removable screw terminal block: <ul style="list-style-type: none"> □ 3 logic inputs: L11 to L13 □ 2 analog inputs: AI2 and AI3 □ 1 relay output: R2 ■ 2 RJ45 connectors for daisy-chain connection to the CANopen machine bus ■ 1 RJ45 connector for connection to the Modbus serial link
------------------	-----------	---

(1) The other specifications of the CANopen Daisy chain card are identical to those of the drive's CANopen protocol. See page 26.

Altivar™ 312 variable speed drives

Option: dialog tools

Remote display terminal with cover open

Remote display terminal with cover closed

Remote display terminal (1)

This terminal is used to locate the human-machine interface of the Altivar™ 312 drive remotely on the door of an enclosure with IP 54 or IP 65 protection.

It is used to:

- Control, adjust and configure the drive remotely
- Display the drive status and faults remotely

Its maximum operating temperature is 50°C.

Description

- 1 4-digit display
- 2 Navigation ▲, ▼ and selection ENT, ESC keys
- 3 Motor local control keys:
 - RUN: starts the motor
 - FWD/REV: reverses the direction of rotation of the motor
 - STOP/RESET: stops the motor/resets drive faults
- 4 Operating mode selection key MODE.
- 5 Cover for optional access to the motor local control keys.

Remote graphic display terminal (2)

This graphic display terminal, common to all the variable speed drive ranges, provides a user-friendly interface for configuration, debugging and maintenance. Its main functions are as follows:

- The graphic screen displays 8 lines of 24 characters of plain text
- The navigation button provides quick and easy access to the drop-down menus
- It is supplied with six languages installed as standard (Chinese, English, French, German, Italian and Spanish). The available languages can be modified using the Multi-Loader configuration tool (VW3 A8 121).

The maximum operating temperature of the terminal is 60°C and it has IP 54 protection.

Description

- 1 Graphic display:
 - 8 lines of 24 characters, 240 x 160 pixels, large digit display
- 2 Function keys (not operational on the Altivar 312)
- 3 **Navigation button:** rotate ±: goes to the next/previous line, increases/decreases the value - press: saves the current value (ENT).
ESC key: aborts a value, a parameter or a menu to return to the previous selection.
- 4 Motor local control keys:
 - RUN: starts the motor
 - STOP/RESET: stops the motor/resets drive faults
 - FWD/REV: reverses the motor direction of rotation
- 5 Remote graphic display terminal
- 6 Remote cable
- 7 Female/female RJ45 adaptor

(2) The software version of the graphic display terminal must be ≥ V1.1.IE19. It can be updated using the Multi-Loader configuration tool (VW3 A8 121). See page 37.

Configuration with SoMove Mobile software for mobile phones

Configuration with Simple Loader configuration tool connected to the ATV 312

Configuration with Multi-Loader configuration tool connected to the ATV 312

SoMove™ setup software

SoMove setup software for PC is used to prepare drive configuration files. The PC can be connected to the drive:

- Directly, using the USB/RJ45 cable (TCSM CNAM 3M002P)
- Using a Bluetooth® wireless connection, via the Modbus™ Bluetooth® adaptor (VW3 A8 114)

See page 38.

SoMove Mobile software for mobile phones (1)

SoMove Mobile software can be used to edit drive configurations on a mobile phone. The configurations can be saved, imported from a PC, exported to a PC or a drive equipped with the Modbus-Bluetooth® adaptor (VW3 A8 114).

The SoMove Mobile software and drive configuration files can be downloaded from our website www.schneider-electric.com.

Simple Loader and Multi-Loader configuration tools

The Simple Loader tool enables one powered-up drive's configuration to be duplicated on another powered-up drive. It is connected to the drive's RJ45 communication port.

The Multi-Loader tool enables several configurations to be copied from a PC or a powered-up drive and loaded on another powered-up drive.

It is connected to:

- A PC via a USB port
- The drive's RJ45 communication port

(1) SoMove Mobile software requires a mobile phone with minimum features, please consult our website www.schneider-electric.com

(2) It also includes other elements for connecting compatible Schneider Electric devices.

SoMove start page

Introduction

SoMove™ is user-friendly setup software for PC designed for configuring the following Schneider Electric motor control devices:

- ATV 12, ATV 312, ATV 31, ATV 32, ATV 61 and ATV 71 drives
- ATS 22 starters
- TeSys™ U starter-controllers
- TeSys T motor management system
- Lexium™ 32 servo drives

SoMove software incorporates various functions for the device setup phases, such as:

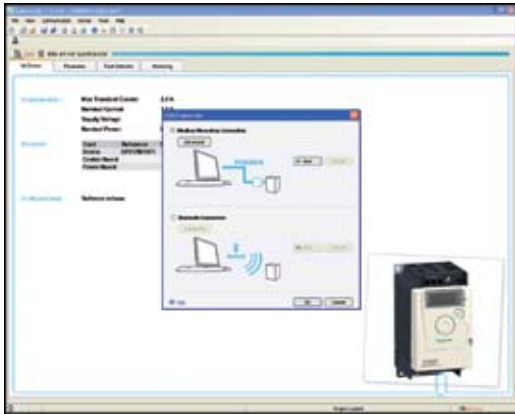

- Configuration preparation
- Start-up
- Maintenance

To facilitate setup and maintenance, SoMove software can use a direct USB/RJ45 cable link or a Bluetooth® wireless link.

SoMove software is also compatible with the Multi-Loader configuration tool and SoMove Mobile software for mobile phones.

These tools can save a significant amount of time when loading, duplicating or editing configurations on a device.

SoMove software and all the DTMs (Device Type Managers) associated with the devices can be downloaded from our website www.schneider-electric.com.

Example of connecting SoMove software to an ATV 12 drive

Functions

Configuration preparation in disconnected mode

SoMove software has a genuine disconnected mode which provides access to all the device parameters. This mode can be used to generate the device configuration. The configuration can be saved, printed and exported to office automation software.

SoMove software also checks the consistency of the parameters, validating the configurations created in disconnected mode.

A large number of functions are available in disconnected mode, in particular:

- The device configuration software wizard
- The configuration comparison function
- Saving, copying, printing and creating configuration files for export to Multi-Loader, SoMove Mobile or Microsoft Excel® tools, and sending configurations by e-mail

Setup

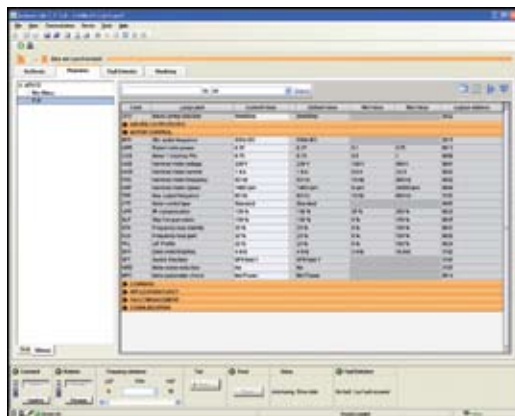

When the PC is connected to the device, SoMove software can be used for:

- Transferring the generated configuration onto the device
- Adjustment and monitoring, which includes such functions as:
 - The oscilloscope
 - Display of communication parameters
- Easy control via the control panel user interface
- Saving the final configuration

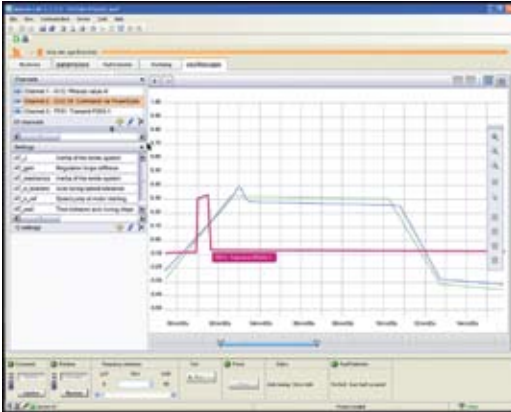

Maintenance

In order to simplify maintenance operations, SoMove software can be used to:

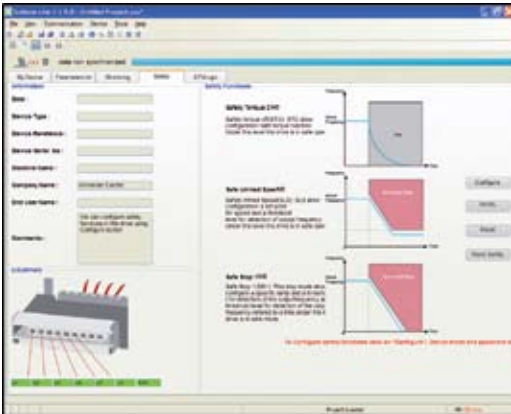

- Compare the configuration of a device currently being used with a configuration saved on the PC
- Transfer a configuration to a device
- Compare oscilloscope curves
- Save oscilloscope curves and faults

SoMove control panel

SoMove oscilloscope function

SoMove Safety function

Functions (continued)

User interface

SoMove™ software provides fast, direct access to all information on the device via five tabs:

- My Device: Displays all the device information (type, reference, software versions, option cards, etc.)
- Parameters: Displays all the device adjustment parameters, shown in a table or in the form of diagrams
- Faults: Displays a list of the faults that may be encountered with the device, the fault log and any current faults or alarms
- Monitoring: Provides a realtime display of the device status, its I/O and all the monitoring parameters. It is possible to create your own control panel by selecting your parameters and how they are to be represented.
- Oscilloscope: Provides a high-speed oscilloscope (for recording traces in the device) or low-speed oscilloscope (for recording traces in the software for devices that do not have an integrated oscilloscope)

SoMove's user interface automatically adapts to the specific configured device by offering additional tabs:

- Safety: For configuring the Safety functions on ATV 32 variable speed drives and Lexium 32 servo drives. It can also be used to:
 - Display the I/O
 - Compile and print a report
- ATVLogic: For accessing the ATV 32 drive's programmable function blocks. It can also be used to:
 - Develop a program and transfer it to the drive
 - Display and debug the program already on the drive
- Auto-tuning: For accessing the servo control settings for the three different operating modes of the Lexium™ 32 servo drive's auto-tuning function:
 - Automatic mode for quick setup, designed for simple applications
 - Semi-automatic mode for quick setup, with the option of optimizing the servo drive/servo motor combination (access to the mechanical and dynamic behavior parameters)
 - Expert mode for optimizing the adjustment parameters, designed for complex applications

Connections

Modbus serial link

The PC running SoMove software can be connected directly via the RJ45 connector on the device and the USB port on the PC using the USB/RJ45 cable.

See the product references on page 40.

Bluetooth® wireless link

SoMove software can communicate via Bluetooth® wireless link with any Bluetooth® enabled device.

If the device is not Bluetooth® enabled, use the Modbus™-Bluetooth® adaptor. This adaptor is connected to the terminal port or the Modbus network port on the device. It has a 20 m range (class 2).

If the PC does not have Bluetooth® technology, use the USB-Bluetooth® adaptor.

See the product references on page 40.

(3) Check the manufacturer's specifications.

Compatibility of SoMove™ software with specific devices

Device	Range	Version of software on the device
Variable speed drive	ATV 12, ATV 312, ATV32	≥ 1.0
	ATV 31	≥ 1.1
	ATV 61, ATV 71	≥ 1.6
Starter	ATS 22	≥ 1.0
Starter-controller	TeSys U	≥ 1.0
Motor management system	TeSys T	≥ 1.0
Servo drive	Lexium 32	≥ 1.0

Environments

SoMove operates in the following PC environments and configurations:

- Microsoft Windows® 7 Professional (1)
- Microsoft Windows® XP Professional SP3
- Microsoft Windows® Vista Business SP2
- Pentium IV (or equivalent), 1 GHz, hard disk with 1 GB available space, 1 GB of RAM (minimum configuration)

(1) Please contact our Customer Care Center.

Introduction

The resistor enables the Altivar™ 312 drive to operate while braking to a standstill or during slowdown braking, by dissipating the braking energy.

Two types of resistor are available:

- Enclosed model (IP 20 casing) designed to comply with the EMC standard and protected by a temperature-controlled switch or thermal overload relay.

This model enables maximum transient braking torque.

The resistors are designed to be mounted on the outside of the enclosure, but should not inhibit natural cooling. Air inlets and outlets must not be obstructed in any way. The air must be free of dust, corrosive gas and condensation.

- Non-protected model (IP 00) for lower power ratings only.

Applications

Machines with high inertia, driving loads and machines with fast cycles.

General specifications

Type of braking resistor			VW3 A7 723 to VW3 A7 725	VW3 A7 701 to VW3 A7 705
Ambient air temperature around the device	Operation	°C	40	0 to + 50
	Storage	°C	- 25 to + 70	
Degree of protection of the casing			IP 00	IP 20
Thermal protection			None	Via temperature-controlled switch or via the drive
Temperature controlled switch (1)	Tripping temperature	°C	–	120
	Max. voltage - max. current		–	250 V ~ - 1 A
	Min. voltage - min. current		–	24 V ~ - 0.1 A
	Maximum switch resistance	mΩ	–	60
Operating factor for the dynamic brake transistors			The average power that can be dissipated at 40°C from the resistor into the casing is determined for a load factor during braking that corresponds to most common applications. The dynamic brake transistor is sized so that it can tolerate: <ul style="list-style-type: none"> - The nominal motor power continuously - 150% of the nominal motor power for 60 s 	

(1) The switch must be connected in the sequence (use for signalling or in line contactor control).

Load factor and determining the nominal power

Load factor: $\frac{t}{T}$

t: braking time in s

T: cycle time in s

Chart 1

Graph of the average power as a function of the braking torque for a load factor

Example:

Motor power $P_m = 4 \text{ kW}$

Motor efficiency $\eta = 0.85$

Braking torque $T_b = 0.6 T_n$

Braking time $t = 10 \text{ s}$

Cycle time $T = 50 \text{ s}$

Load factor $f_m = \frac{t}{T} = 20\%$

Use chart 1 to determine coefficient K_1 corresponding to a braking torque of $0.6 T_n$ and a load factor of 20%:

$K_1 = 0.06$

The average power that can be dissipated at 40°C from the resistor into the casing is determined for a load factor during braking that corresponds to most common applications. This load factor is defined in the table above.

For a specific application (example: handling), the nominal power of the resistor must be redefined incorporating the new load factor.

Chart 2

Permissible resistor overload as a function of time (characteristic curve)

Use chart 2 to determine coefficient K_2 corresponding to a braking time of 10 seconds.

$K_2 = 7$

The nominal power of the resistor (P_n) must be greater than:

$$P_n = P_m \times K_1 \times \eta \left(1 + \frac{1}{K_2 \times f_m}\right) = 4.10^3 \times 0.06 \times 0.8 \left(1 + \frac{1}{7 \times 0.2}\right) = 350 \text{ W}$$

(1) Depends on the drive rating.

(2) Power that can be dissipated by the resistor at the maximum temperature of 115°C, corresponding to a maximum temperature rise of 75°C in a 40°C environment.

(3) Ohmic value obtained as a function of the connection described in the resistor operating instructions.

Altivar™ 312 variable speed drives

Option: line chokes

Introduction

Line chokes provide improved protection against overvoltages on the line supply and reduce harmonic distortion of the current produced by the drive.

The recommended chokes limit the line current.

They have been developed in line with standard IEC 61800-5-1 (VDE 0160 level 1 high-energy overvoltages on the line supply).

The inductance values are defined for a voltage drop between 3% and 5% of the nominal line voltage. Values higher than this will cause loss of torque.

The use of line chokes is recommended in particular for ATV 312H●●●M2, ATV 312H●●●M3 and ATV 312H●●●N4 drives under the following circumstances:

- Line supply with significant disturbance from other equipment (interference, overvoltages)
- Line supply with voltage imbalance between phases > 1.8% of nominal voltage
- Drive supplied by a line with very low impedance (in the vicinity of a power transformer 10 times more powerful than the drive rating)
- Installation of a large number of frequency inverters on the same line
- Reduction of overloads on the cos φ correction capacitors, if the installation includes a power factor correction unit

The use of line chokes is mandatory for ATV 312H●●●S6 drives.

The prospective short-circuit current at the drive connection point must not exceed the maximum value indicated in the reference tables. The use of chokes allows connection to the following line supplies:

- Max. Isc 22 kA for 200/240 V
- Max. Isc 65 kA for 380/500 V and 525/600V

Altivar™ 312 variable speed drives

Integrated EMC filters and optional additional EMC filters

Introduction

Integrated filters

Altivar™ 312 drives, apart from ATV 312H●●●M3 and ATV312H●●●S6, have integrated radio interference input filters to comply with the EMC standard for variable speed electrical power drive "products" IEC 61800-3, categories C2 or C3, and to comply with the European EMC (electromagnetic compatibility) directive.

Additional EMC input filters

Additional EMC input filters (1) enable drives to meet more stringent requirements: they are designed to reduce conducted emissions on the line supply below the limits of standard IEC 61800-3 category C1 or C2 (see page 47).

These additional EMC filters can be mounted beside or under the drive. They act as a support for the drives and are attached to them via tapped holes.

Use according to the type of line supply

Additional EMC filters can only be used on TN (neutral connection) and TT (neutral to ground) type systems.

Standard IEC 61800-3, appendix D2.1, states that on IT systems (isolated or impedance grounded neutral), filters can cause permanent insulation monitors to operate in a random manner.

The effectiveness of additional filters on this type of system depends on the type of impedance between neutral and ground, and therefore cannot be predicted. If a machine has to be installed on an IT system, one solution is to insert an isolation transformer and connect the machine locally on a TN or TT system.

Specifications

Conformity to standards			EN 133200
Degree of protection			IP 21 and IP 41 on upper part
Maximum relative humidity			95% non-condensing, no dripping water conforming to IEC 60068-2-3

(1) The filter selection tables give the maximum lengths for shielded cables connecting motors to drives for a switching frequency of 2 to 16 kHz. These maximum lengths are given as examples only, as they vary depending on the stray capacitance of the motors and the cables used. If motors are connected in parallel, the sum of the cable lengths must be taken into account.

(2) In: nominal filter current.

(3) II: maximum ground leakage current at 50 Hz.

(4) Via heat dissipation, at the nominal filter current (In).

- Category C1: public power supply (residential)

- Category C2: industrial power supply

Altivar™ 312 variable speed drives

Options: output filters, motor chokes and ferrite suppressors

Introduction

Output filters and motor chokes can be inserted between the Altivar™ 312 drive and the motor to:

- Limit the dv/dt at the motor terminals (500 to 1500 V/μs), for cables longer than 50 m
- Filter interference caused by opening a contactor placed between the filter and the motor
- Reduce the motor ground leakage current

The output filter range features LR filter cells.

Ferrite suppressors are necessary on ATV 312H●●●M2 and ATV 312H018M3 to HU22M3 drives when an output contactor is used.

LR filter cell

This cell features 3 high-frequency chokes and 3 resistors.

The LR filter cell is particularly suitable for:

- Reducing the dv/dt at the motor terminals
- Using long motor cables (see specifications table page 49)

Motor choke

The motor choke is particularly suitable for:

- Reducing overvoltages at the motor terminals (see length of motor cable in specifications table page 49)
- Minimizing the current wave, thus reducing motor noise

Ferrite suppressors for downstream contactor opening

Ferrite suppressors for downstream contactor opening are inserted on the motor cable between ATV 312H●●●M2 or ATV 312H018M3 to HU22M3 drives and the output contactor.

(1) Filter performance is ensured if the cable lengths between the motor and the drive, given in the above table, are not exceeded. For an application with several motors connected in parallel, the cable length must include all cabling. If a cable longer than that recommended is used, the filters may overheat.

(2) For other LR filter configurations, please consult your Customer Care Center.

Three-phase power supply

Connections ensuring conformity to EMC standards

Principle

- Grounds between the drive, motor and cable shielding must have "high-frequency" equipotentiality.
- Use shielded cables with the shielding connected to ground throughout 360° at both ends for the motor cable, the braking resistor cable and the control-signal cables. Metal conduit or ducting can be used for part of the shielding length provided that there is no break in the continuity of the ground connection.
- Ensure maximum separation between the power supply cable and the motor cable.

Installation diagram

- 1 Steel plate to be mounted on the drive (grounded casing)
- 2 Altivar™ 312 drive
- 3 Unshielded power supply wires or cable
- 4 Unshielded wires or cable for the output of the fault relay contacts
- 5 Attach and ground the shielding of cables 6, 7 and 8 as close as possible to the drive:
 - Strip the cable to expose the shielding
 - Attach the cable to the plate 1, attaching the clamp on the stripped part of the shielding.
 The shielding must be clamped tightly enough to the metal sheet to ensure good contact.
 For cables 6, 7 and 8, the shielding must be connected to ground at both ends. The shielding must be continuous, and if intermediate terminals are used, they must be placed in EMC shielded metal boxes.
- 6 Shielded cable for connecting the motor
- 7 Shielded cable for connecting the control-signal wiring. For applications requiring several conductors, use cables with a small cross-section (0.5 mm²).
- 8 Shielded cable for connecting the braking resistor
- 9 PE cable (green-yellow)

Note: The HF equipotential ground connection between the drive, motor and cable shielding does not remove the need to connect the PE conductors (green-yellow) to the appropriate terminals on each device. If using an additional EMC input filter, it must be mounted under the drive and connected directly to the line supply via an unshielded cable. Link 3 on the drive is then via the filter output cable.

Operation on an IT system (isolated or impedance grounded neutral)

Use a permanent insulation monitor compatible with non-linear loads, such as the Schneider Electric XM200 (please consult our website www.schneider-electric.com or contact your Customer Care Center).

ATV 312H...M2 and ATV 312H...N4 drives have integrated EMC filters. For use on an IT system, these filters can be disconnected by removing their ground connection:

- For ATV 312H018M2 to HU22M2 and H037N4 to HU40N4 drives, remove a jumper to disconnect the filter.
- For ATV 312HU55N4 to HD15N4 drives, move the wire with the cable tag to disconnect the filter.

Installation

Depending on the conditions in which the drive is to be used, its installation will require certain precautions and the use of appropriate accessories.

Install the unit vertically, at $\pm 10^\circ$:

- Do not place it close to heating elements
- Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit

Mounting types

■ Type A mounting

■ Type B mounting

■ Type C mounting

Removing the protective cover

Removing the protective cover from the top of the drive (as shown opposite) changes the degree of protection to IP 20.

Derating curves for the nominal drive current (I_n) as a function of temperature, switching frequency and mounting type.

For intermediate temperatures (for example, 55°C), interpolate between 2 curves.

Mounting in an enclosure

Follow the mounting recommendations on the opposite page.

To ensure proper air circulation in the drive:

- Install ventilation grills
- Ensure that there is sufficient ventilation. If there is not, install a forced ventilation unit with a filter. The openings and/or fans must provide a flow rate at least equal to that of the drive fans (see below).
- Use special filters with IP 54 protection
- Remove the protective cover from the top of the drive

Fan flow rate depending on the drive rating

ATV 312	Flow rate m ³ /min
H018M2 to H055M2 H018M3 to H055M3 H037N4 to HU11N4 H075S6, HU15S6	0.3
H075M2 to HU15M2 H075M3 to HU15M3 HU15N4, HU22N4 HU22S6, HU40S6	0.55

HU55M3 HU55N4, HU75N4 HD11S6	1.7
HU75M3, HD11M3 HD11N4, HD15N4 HD15S6	2.8
HD15M3	3.6

Metal dust and damp proof wall-mounted or floor-standing enclosure (IP 54 degree of protection)

The drive must be mounted in a dust and damp proof enclosure in certain environmental conditions: dust, corrosive gases, high humidity with risk of condensation and dripping water, splashing liquid, etc. This enables the drive to be used in an enclosure where the maximum internal temperature can reach 50°C.

Calculating the dimensions of the enclosure

Maximum thermal resistance R_{th} (°C/W)

$$R_{th} = \frac{\theta^{\circ} - \theta_e}{P}$$

θ° = maximum temperature inside the enclosure in °C
 θ_e = maximum external temperature in °C
 P = total power dissipated in the enclosure in W

Power dissipated by drive: see page 28.

Add the power dissipated by the other components of the device.

Useful heat exchange area of enclosure S (m²)

(sides + top + front panel if wall-mounted)

$$S = \frac{K}{R_{th}}$$

K = thermal resistance per m² of the enclosure

For metal enclosures:

- K = 0.12 with internal fan
- K = 0.15 without fan

Note: Do not use insulated enclosures, as they have a poor level of conductivity.

Altivar™ 312 variable speed drives

Motor starters

Applications

The combinations listed below can be used to assemble a complete motor starter comprising a circuit-breaker, a contactor and an Altivar™ 312 variable speed drive. The circuit-breaker provides protection against accidental short-circuits, disconnection and, if necessary, isolation.

The contactor controls and manages any safety features and isolates the motor on stopping.

The Altivar 312 drive is protected electronically against short-circuits between phases and between phase and ground. It therefore ensures continuity of service and thermal protection of the motor.

ATV 312H075M2 with front panel door open

3 operating modes: REF, MON and CONF

Drive factory configuration

The Altivar™ 312 drive is configured to allow a quick start-up for most applications. Factory configuration:

- Nominal motor frequency: 50 Hz
- Motor voltage: 230 V (ATV 312H●●●M2, ATV 312H●●●M3), 400 V (ATV 312H●●●N4) or 600 V (ATV 312H●●●S6)
- Linear ramp times: 3 seconds
- Low speed (LSP): 0 Hz/High speed (HSP): 50 Hz
- Normal stop mode on deceleration ramp
- Stop mode in the event of a fault: freewheel
- Motor thermal current = nominal drive current
- Standstill injection braking current = 0.7 x nominal drive current, for 0.5 seconds
- Constant torque operation with sensorless flux vector control
- Logic inputs:
 - 2 directions of operation (LI1, LI2), 2-wire control
 - 4 preset speeds (LI3, LI4): LSP (low speed), 10 Hz, 15 Hz, 20 Hz
- Analog inputs:
 - AI1 speed reference (0 +10 V)
 - AI2 (0 ± 10 V) summing of AI1
 - AI3 (4-20 mA) not configured
- Relay R1: fault relay
- Relay R2: not assigned
- Analog output AOC: 0-20 mA, image of the motor frequency
- Automatic adaptation of the deceleration ramp in the event of overbraking
- Switching frequency 4 kHz, random frequency

Human-Machine Interface (HMI)

Description

- 1 Display:
 - 4-digit display
 - Display of numeric values and codes
 - Indication of the unit of the displayed value
- 2 Display of the drive status:
 - **REF**: Reference mode. This mode is used to display the motor frequency reference of the active reference channel (terminals, local mode, remote display terminal or Modbus™ serial link). In local mode, the reference can be modified using the navigation button 4, if the function is configured.
 - **MON**: Monitoring mode. This mode is used to display the monitoring parameters when the drive is running.
 - **CONF**: Configuration mode. This mode is used to configure the drive parameters. These parameters can be modified using the SoMove™ setup software.
- 3 Use of the keys:
 - **MODE** is used to access one of the following modes:
 - Reference mode REF
 - Monitoring mode MON
 - Configuration mode CONF
 - Note**: This key cannot be accessed if the front panel door is closed.
 - **ESC**: Aborts a value, a parameter or a menu to return to the previous selections
 - **STOP/RESET**: Local motor stop command, clears drive faults (key active in factory configuration)
 - **RUN**: Local motor run command, if its activation is programmed
- 4 Use of the navigation button:
 - Rotate: Increases or decreases the value, or goes to the next value
 - Press: Saves the current value or selects the value
 - The button can be used as a potentiometer in local mode
- 5 Cover that can be removed for access to the RUN and STOP/RESET keys.
- 6 It is possible to lock the front panel door with a lead seal.

Application functions

■ Operating speed range

This function is used to determine the 2 frequency limits which define the speed range permitted by the machine under actual operating conditions for all applications with or without overspeed.

LSP: low speed, from 0 to HSP, factory setting 0
 HSP: high speed, from LSP to f max., factory setting 50 Hz
 X: configurable between 0 and 20 mA, factory setting 4 mA
 Y: configurable between 4 and 20 mA, factory setting 20 mA

■ Acceleration and deceleration ramp times

This function is used to define acceleration and deceleration ramp times according to the application and the machine dynamics.

Linear acceleration ramp

Linear deceleration ramp

t1: acceleration time
 t2: deceleration time

t1 and t2 can be set independently between 0.1 and 999.9 s, factory setting: 3 s

■ Acceleration and deceleration ramp profiles

These enable a gradual change in the output frequency starting from a speed reference, following a linear profile or a preset profile.

□ S ramps

For applications such as material handling, packaging and passenger transport, the use of S ramps takes up mechanical backlash, eliminates jolts, and limits "non-following" of speed during rapid transient operation of high-inertia machines.

□ U ramps

U ramps are specifically for pumping applications, for example an installation with centrifugal pump and non-return valve. They provide better control of closing of the non-return valve.

Selecting linear, S, U or customized profiles assigns both the acceleration and deceleration ramps.

S ramps

HSP: high speed
 t1: ramp time set
 t2 = 0.6 x t1
 The rounding coefficient is mounted.

U ramps

HSP: high speed
 t1: ramp time set
 t2 = 0.5 x t1
 The rounding coefficient is mounted.

Customized ramps

HSP: high speed
 tA1: adjustable between 0 and 100% (of ACC or AC2)
 tA2: can be set between 0 and (100% - tA1) (of ACC or AC2)
 tA3: can be set between 0 and 100% (of dEC or dE2)
 tA4: can be set between 0 and (100% - tA3) (of dEC or dE2)
 ACC: acceleration ramp 1 time
 AC2: acceleration ramp 2 time
 dEC: deceleration ramp 1 time
 dE2: deceleration ramp 2 time

■ Ramp switching

This function is used to switch two acceleration and deceleration ramp times, which can be adjusted separately.

Ramp switching can be enabled by:

- A logic input
- A frequency threshold
- A combination of logic input and frequency threshold

This function is suitable for:

- Material handling with smooth starting and approach
- Machines with fast steady state speed correction

Acceleration 1 (ACC) and deceleration 1 (dEC):

- Adjustment 0.1 to 999.9 s
- Factory setting 3 s

Acceleration 2 (AC2) and deceleration 2 (dE2):

- Adjustment 0.1 to 999.9 s
- Factory setting 5 s

HSP: high speed

Example of switching using logic input LI4

■ Automatic adaptation of deceleration ramp

This function is used to automatically adapt the deceleration ramp if the initial setting is too low for the inertia of the load. It avoids the drive locking in the event of an **overbraking** fault.

The function is suitable for all applications which do require precise stopping and do not use braking resistors.

Automatic adaptation must be cancelled if the machine has position control with stopping on a ramp and a braking resistor installed. It is automatically disabled if the brake sequence is configured.

■ **Voltage/frequency ratio**

- Motor and power supply specifications

This function is used to determine the limit values for the voltage/frequency ratio according to the specifications of the line supply, motor and application.

The following values should be set for constant or variable torque applications with or without overspeed:

- The base frequency corresponding to the line supply
- The nominal motor frequency (in Hz) given on the motor rating plate
- The nominal motor voltage (in V) given on the motor rating plate
- The maximum output frequency of the drive (in Hz)

■ **Type of voltage/frequency ratio**

This is used to adapt the voltage/frequency ratio to the application in order to optimize performance for the following applications:

- Constant torque applications (machines with average loads operating at low speed) with motors connected in parallel or special motors (e.g. resistive cage motor): ratio **L**
- Variable torque applications (pumps, fans): ratio **P**
- Machines with heavy loads operating at low speed, machines with fast cycles, with (sensorless) flux vector control: ratio **n**
- Energy saving, for machines with slow torque and speed variations: ratio **nLd**.

The voltage is automatically reduced to minimum according to the necessary torque.

Un: nominal motor voltage
fm: nominal motor frequency

■ **Auto-tuning**

Auto-tuning can be performed:

- Voluntarily by the operator using dialog tools via local control or the serial link
- Each time the drive is switched on
- On each run command
- By enabling a logic input

Auto-tuning is used to optimize application performance.

■ **Switching frequency, noise reduction**

Adjusting the switching frequency setting reduces the noise generated by the motor. The switching frequency is modulated randomly in order to avoid resonance. This function can be disabled if it causes instability.

High frequency switching of the intermediate DC voltage can be used to supply the motor with a current wave that has little harmonic distortion. The switching frequency can be adjusted during operation to reduce the noise generated by the motor.

Value: 2 to 16 kHz. Factory setting 4 kHz

For all applications which require low motor noise.

■ Skip frequencies

This function suppresses one or two critical speeds that may cause mechanical resonance.

It is possible to prohibit prolonged operation of the motor on 1 or 2 frequency bands (± 1 Hz), around an adjustable frequency on the speed range.

This function is suitable for lightweight machines, bulk product conveyors with an unbalanced motor, fans and centrifugal pumps.

Motor speed change depending on the skip frequency reference

■ Speed reference

The speed reference can come from different sources, depending on the drive configuration:

- References provided by 3 analog inputs
- The navigation button reference
- The +/- speed function via logic input, using the keypad or remote display terminal keys
- The remote display terminal reference
- Speed references provided by the communication bus or networks

These sources are managed by programming the reference functions and channels.

■ Analog inputs

There are 3 analog inputs:

- 2 voltage inputs:
 - 0-10 V (AI1)
 - ± 10 V (AI2)
- 1 current input:
 - X-Y mA (AI3), where X is configurable between 0 and 20 mA, and Y is configurable between 4 and 20 mA

■ Preset speeds

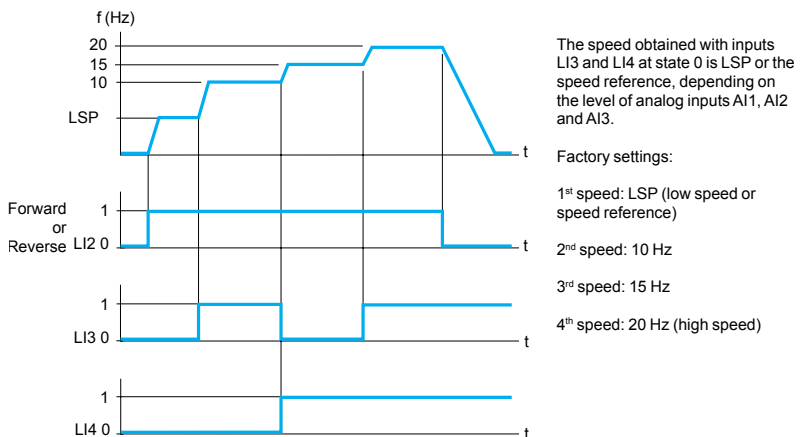

This function is used to switch preset speed references.

Choose between 2, 4, 8 or 16 preset speeds.

Enabled by means of 1, 2, 3 or 4 logic inputs.

The preset speeds are adjustable in increments of 0.1 Hz from 0 Hz to 500 Hz.

This function is suitable for material handling and machines with several operating speeds.

The speed obtained with inputs LI3 and LI4 at state 0 is LSP or the speed reference, depending on the level of analog inputs AI1, AI2 and AI3.

Factory settings:

- 1st speed: LSP (low speed or speed reference)
- 2nd speed: 10 Hz
- 3rd speed: 15 Hz
- 4th speed: 20 Hz (high speed)

Example of operation with 4 preset speeds and 2 logic inputs

Altivar™ 312 variable speed drives

■ +/- speed

This function is used to increase or decrease a speed reference by means of 1 or 2 logic inputs, with or without the last reference being saved (motorized potentiometer function).

This function is suitable for centralized control of a machine with several sections operating in one direction or for control by a pendant control station of a material handling crane with two operating directions.

Two types of operation are available:

- Use of single-action buttons: two logic inputs are required in addition to the operating direction(s).

The input assigned to the + speed command increases the speed, the input assigned to the - speed command decreases the speed.

Example of +/- speed with 2 logic inputs, single-action buttons and reference saving

- Use of double-action buttons (only one logic input assigned to + speed is necessary).

Logic inputs:

	Released (- speed)	1 st press (speed maintained)	2 nd press (+ speed)
Forward button	-	a	a and b
Reverse button	-	c	c and d

LSP: low speed; HSP: high speed

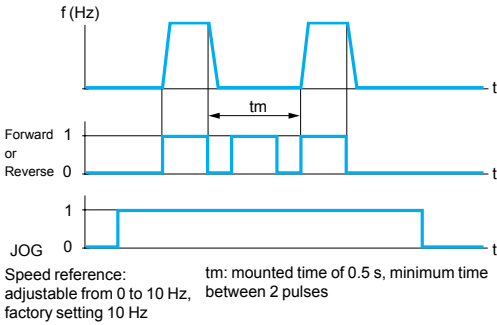

Example with double-action buttons and 1 logic input

Note: This type of +/- speed control is incompatible with 3-wire control.

■ Save reference

This function is associated with +/- speed control.

It enables the last speed reference prior to the loss of the run command or line supply to be read and saved. The saved reference is applied to the next run command.

Example of jog operation

■ Jog operation

This function is used for pulse operation with minimum ramp times (0.1 s), a limited speed reference and minimum time between 2 pulses. It is enabled by 1 logic input and pulses given by the operating direction command.

This function is suitable for machines with product insertion in manual mode (e.g. gradual movement of the mechanism during maintenance operations).

■ Command and reference channels

There are several command and reference channels, which can be independent. Commands (forward, reverse, etc.) and speed references can be given via the following channels:

- Terminals (logic inputs and analog I/O)
- Local mode (STOP/RESET and RUN keys and navigation button)
- Remote display terminal
- Serial link:
 - Remote display terminal
 - Modbus control word
 - CANopen control word

The command channels and speed reference channels can be separate. E.g. speed reference issued by CANopen and command issued by the remote display terminal.

Note: The STOP/RESET keys on the Human-Machine interface keypad and the remote display terminal can retain their priority. The Summing inputs and PI regulator functions only apply to one reference channel.

Example of reference switching

■ Reference switching

Switching between 2 speed references can be enabled via:

- A logic input
 - A bit in a Modbus or CANopen control word
- Reference 1 is active if the logic input (or control word bit) is at 0. Reference 2 is active if the logic input (or control word bit) is at 1. The reference can be switched with the motor running.

Connection diagram for reference switching

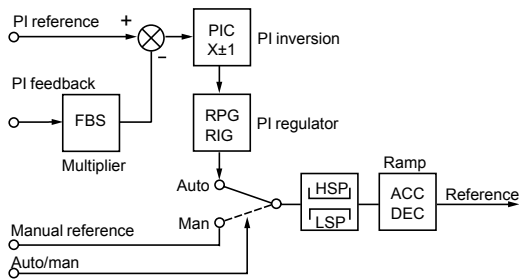

■ Summing inputs

This function is used to add together 2 to 3 speed references from different sources. The references to be added together are selected from all the possible types of speed reference.

E.g.

- Reference 1 from AI1
- Reference 2 from AI2
- Reference 3 from AIP

Drive speed reference = reference 1 + reference 2 + reference 3.

ACC: Acceleration
 DEC: Deceleration
 FBS: PI feedback multiplication coefficient
 HSP: High speed
 PIC: Reversal of the direction of correction of the PI regulator
 LSP: Low speed
 RIG: PI regulator integral gain
 RPG: PI regulator proportional gain

PI feedback

■ PI regulator

This function is used for simple control of a flow rate or a pressure with a sensor supplying a feedback signal adapted to the drive. It is suitable for pumping and ventilation applications.

□ PI reference:

- Internal regulator reference, adjustable from 0 to 100
- Regulation reference selected from all the possible types of regulation reference
- Preset PI references

□ **2 or 4 preset PI references** adjustable from 0 to 100, require the use of 1 or 2 logic inputs respectively

□ Manual reference

- Speed reference selected from all the possible types of speed reference

□ PI feedback:

- Analog input AI1, AI2 or AI3

□ Auto/Man:

- Logic input LI for switching operation to speed reference (Man) or PI regulation (Auto)

During operation in automatic mode, the process feedback can be adapted to correct inverse PI, adjust the proportional and integral gain, or apply a ramp (time = ACC - DEC) for establishing the PI action on starting and stopping.

The motor speed is limited to between LSP and HSP.

Note: The PI function is incompatible with the Preset speeds and JOG functions. The PI reference can also be transmitted on line via the Modbus™ RS 485 serial link or via the CANopen™ bus.

■ Current limit switching

A second current limit can be configured between 0.25 and 1.5 times the nominal drive current.

This function limits the torque and the temperature rise of the motor.

Switching between the two current limits can be enabled via:

- A logic input
- A bit in a Modbus or CANopen control word

■ Limiting low speed operating time

The motor is stopped automatically after a period of operation at low speed (LSP) with a zero reference and a run command present.

This time can be set between 0.1 and 999.9 seconds (0 corresponds to an unlimited time). Factory setting: 0 s. The motor restarts automatically on the ramp when the reference reappears or if the run command is interrupted and then re-established.

This function is suitable for automatic stopping/starting of pressure-regulated pumps.

■ Motor switching

This function allows two motors with different powers to be supplied alternately by the same drive. Switching must take place with the drive stopped and locked, using an appropriate sequence at the drive output.

The function can be used to adapt the motor parameters. The following parameters are switched automatically:

- Nominal motor voltage
- Nominal motor frequency
- Nominal motor current
- Nominal motor speed
- Motor cosine Phi (power factor)
- Selection of the type of voltage/frequency ratio for motor 2
- IR compensation, motor 2
- Motor frequency loop gain
- Motor stability
- Motor slip compensation

Motor thermal protection is disabled by this function.

Motor switching can be enabled by:

- A logic input
- A bit in a Modbus or CANopen control word

With hoisting applications, this function enables a single drive to be used for vertical and horizontal movements.

■ Control mode switching

Switching the command channel provides a choice of 2 control modes. Switching is enabled by:

- A logic input
- A bit in a Modbus™ or CANopen™ control word

■ 2-wire control

This function is used to control the direction of operation by means of a stay-put contact. It is enabled by means of 1 or 2 logic inputs (one or two directions of operation).

This function is suitable for all non-reversing and reversing applications.

Three operating modes are possible:

- Detection of the state of the logic inputs
- Detection of a change of state of the logic inputs
- Detection of the state of the logic inputs with forward operation having priority over reverse

Wiring diagram for 2-wire control

Example of 3-wire control operation

■ 3-wire control

This function is used to control the operating direction and stopping by means of pulsed contacts.

It is enabled by means of 2 or 3 logic inputs (1 or 2 directions of operation).

It is suitable for all non-reversing and reversing applications.

Wiring diagram for 3-wire control

■ Forced local mode

Forced local mode imposes control via the terminals or display terminal and disables all other control modes.

The following references and commands are available for forced local mode:

- References AI1, or AI2, or AI3 and command via logic inputs
- Reference and command via RUN and STOP/RESET keys and the navigation button
- Reference and command via the remote display terminal

The changeover to forced local mode is enabled by a logic input.

■ Freewheel stop

This stops the motor by resistive torque if the motor power supply is cut.

A freewheel stop is achieved by:

- Configuring a normal stop command as a freewheel stop (on disappearance of a run command or appearance of a stop command)
- Enabling a logic input

■ Fast stop

This is used to achieve a braked stop with a deceleration ramp time (divided by 2 to 10) that is acceptable for the drive/motor unit without locking on an overbraking fault. It is used for conveyors with electrical emergency stop braking.

A fast stop is achieved by:

- Configuring a normal stop as a fast stop (on disappearance of a run command or appearance of a stop command)
- By enabling a logic input

■ DC injection stop

This function is used for low speed braking of high-inertia fans, or for maintaining torque when stopping fans located in an airflow.

A DC injection stop is achieved by:

- Configuring a normal stop as a DC injection stop (on disappearance of a run command or appearance of a stop command)
- Enabling a logic input

The DC value and the standstill braking time are adjustable.

Accessible settings:
 t1: brake release time delay
 t2: brake engage time delay

Brake control

■ **Brake control**

This function is used to manage control of an electromagnetic brake in synchronization with starting and stopping the motor to avoid jolts and speed errors. The brake control sequence is managed by the drive.

Adjustable values for releasing the brake: current threshold and time delay
 Adjustable values for engaging the brake: frequency threshold and time delay
 Enabled by: relay logic output R2 or logic output AOC assigned to brake control.
 This function is suitable for material handling applications with movements equipped with electromagnetic brakes (hoisting) and machines requiring holding brake control (unbalanced machines).

■ **Principle:**

- Vertical hoisting movement: Maintains motor torque in an upward direction when the brake is being released and engaged, in order to hold the load and start smoothly as soon as the brake is released.
- Horizontal hoisting movement: Synchronizes brake release with the build-up of torque during starting and brake engage at zero speed on stopping, to prevent jolting.

The recommended brake control settings for vertical hoisting applications are as follows (for horizontal hoisting applications, set the current threshold to zero):

- Brake release current: Set the brake release current to the nominal current indicated on the motor. If, during testing, the torque is insufficient, increase the brake release current (the maximum value is imposed by the drive).
- Acceleration time: For hoisting applications it is advisable to set the acceleration ramps to more than 0.5 seconds. Ensure that the drive does not change to current limiting.

The same recommendation applies for deceleration.

Note: For a hoisting movement, a braking resistor should be used. Ensure that the selected settings and configurations will not result in dropping or loss of control of the load being lifted.

- Brake release time delay t1: Adjust according to the type of brake. It is the time required for the mechanical brake to release.
- Brake engage frequency: Set to twice the nominal slip, then adjust according to the result.
- Brake engage time delay t2: Adjust according to the type of brake. It is the time required for the mechanical brake to engage.

■ **Limit switch management**

This function is used to manage the operation of one or two limit switches (with 1 or 2 operating directions).

Each limit (forward, reverse) is associated with a logic input. The type of stop that occurs on detection of a limit is configurable as normal, freewheel or fast stop. Following a stop, the motor is permitted to restart in the opposite direction only.

■ **Monitoring**

The following data can be displayed:

- Frequency reference
- Internal PI reference
- Frequency reference (absolute value)
- Output frequency applied to the motor (value signed in two's complement)
- Output frequency in customer units
- Current in the motor
- Motor power: 100% = nominal power
- Line voltage
- Motor thermal state:
 - 100%: nominal thermal state, 118%: motor overload threshold
- Drive thermal state:
 - 100%: nominal thermal state, 118%: drive overload threshold
- Motor torque: 100% = nominal torque
- Last detected fault
- Operating time
- Auto-tuning status
- Configuration and state of logic inputs
- Configuration of analog inputs

■ Fault management

There are various operating modes in the event of resettable faults:

- Freewheel stop
- The drive switches to the fallback speed
- The drive maintains the speed at which it was operating when the fault occurred, until the fault disappears
- Stop on ramp
- Fast stop

The following resettable faults are detected:

- Drive overheating
- Motor overheating
- CANopen™ bus fault
- Modbus™ serial link failure
- External faults
- Loss of 4-20 mA signal

■ Fault reset

This function is used to clear the last fault by means of a logic input.

The restart conditions after a reset are the same as those for a normal power-up.

Resets the following faults: overvoltage, overspeed, external fault, drive overheating, output phase loss, DC bus overvoltage, loss of 4-20 mA reference, load slipping, motor overload if the thermal state is less than 100%, serial link fault.

Line supply undervoltage and input phase loss faults are reset automatically when the line supply is restored.

This function is suitable for applications where the drives are difficult to access, for example on moving parts or in material handling systems.

■ General reset (disables all faults)

This function disables all faults, including thermal protection (forced operation), and can result in irreparable damage to the drive.

This invalidates the warranty.

This function is suitable for applications where restarting may be crucial (conveyor in an oven, smoke extraction system, machines with solidifying products that need to be removed).

The function is enabled by a logic input.

Fault monitoring is active if the logic input is at state 1.

All faults are reset on a change of state \uparrow of the logic input.

■ Controlled stop on loss of line supply

This function is used to control motor stopping on a loss of line supply.

It is suitable for material handling, machines with high inertia, continuous product processing machines.

Possible types of stop:

- Locking of the drive and freewheel stop
- Stop which uses the mechanical inertia to maintain the drive power supply as long as possible
- Stop on ramp
- Fast stop (depends on the inertia and the braking ability of the drive)

■ Stop mode in the event of a fault

The type of stop that occurs on detection of a fault is configurable as normal, freewheel or fast for the following faults:

- External fault (detection enabled by a logic input or a bit in a Modbus or CANopen control word)
- Motor phase loss fault

If an output contactor is being used between the drive and the motor, the motor phase loss fault should be disabled.

■ **Automatic catching of a spinning load with speed detection** (“catch on the fly”)

This function is used to restart the motor smoothly after one of the following events, provided the run command is still present:

- Loss of line supply or power off
- Fault reset or automatic restart
- Freewheel stop

On disappearance of the event, the rms speed of the motor is detected in order to restart on a ramp from this speed and return to the reference speed. Speed detection can take up to 1 s depending on the initial deviation.

This function is automatically disabled if the brake sequence is configured.

It is suitable for machines for which the motor speed loss is negligible during the loss of line supply (such as machines with high inertia, fans and pumps driven by a residual flow, etc.).

■ **Automatic restart**

This function enables the drive to be restarted automatically after it has locked in fault mode, provided the fault has disappeared and the other operating conditions permit a restart.

This restart is performed by a series of automatic attempts separated by increasingly longer waiting periods of 1 s, 5 s, 10 s, then 1 minute for subsequent periods.

The restart procedure can last between 5 minutes and an unlimited time.

If the drive has not restarted after the configured time, it will lock and the procedure is abandoned until it has been powered off and on again.

The faults which permit this type of restart are:

- Line overvoltage
- Motor thermal overload
- Drive thermal overload
- DC bus overvoltage
- Loss of one input phase
- External fault
- Loss of 4-20 mA reference
- CANopen™ bus fault
- Modbus™ serial link fault
- Line voltage too low. For this fault, the function is always active, even if it is not configured.

For these faults, the relay configured as a fault relay remains activated if the function is configured. The speed reference and direction of operation must be maintained for this function.

This function is suitable for machines or installations which are in continuous operation or are not monitored, and where a restart will not endanger equipment or personnel in any way.

■ **Derated operation in the event of an undervoltage**

The line voltage monitoring threshold is lowered to 50% of the motor voltage.

In this case, a line choke must be used and the performance of the drive cannot be guaranteed.

■ **Fault relay, unlocking**

The fault relay is energized when the drive is powered up and is not faulty.

It contains an N/C contact and an N/O contact with common point.

The drive is unlocked after a fault in one of the following ways:

- By powering down until the ON LED goes out, then switching the drive back on
- By assigning a logic input to the External faults function
- By the Automatic restart function, if it has been configured

■ **Resetting operating time to zero**

The drive operating time can be reset to zero.

■ **Motor thermal protection**

The theoretical temperature rise of the motor is continuously calculated to provide indirect thermal protection. Thermal protection is adjustable from 0.2 to 1.5 times the nominal drive current. This function is suitable for all applications with self-cooled motors.

Motor thermal protection curves

■ **Drive thermal protection**

Thermal protection, by a PTC probe mounted on the heatsink or integrated in the power module, ensures that the drive is protected in the event of poor ventilation or excessive ambient temperatures. Locks the drive in the event of a fault.

Drive thermal protection curves

■ **R1/R2 relay configuration**

The following states are signalled when the relay is powered on:

- Drive fault
- Drive running
- Frequency threshold reached
- High speed reached
- Current threshold reached
- Frequency reference reached
- Motor thermal threshold reached
- Brake sequence (R2 only)

■ AOC/AOV analog outputs

The same data is available on analog outputs AOC and AOV.

The following assignments are possible:

- Motor current
- Motor frequency
- Motor torque
- Power supplied by the drive
- Drive fault
- Frequency threshold reached
- High speed reached
- Current threshold reached
- Frequency reference reached
- Motor thermal threshold reached
- Brake sequence

Adjusting analog outputs AOC/AOV modifies the specifications of the current analog output AOC or the voltage analog output AOV.

AOC: can be set as 0-20 mA or 4-20 mA

AOV: can be set as 0-10 V

■ Saving and retrieving the configuration

It is possible to save a configuration. This function is used to store a drive configuration in addition to the current configuration.

Retrieving this configuration clears the current configuration.

Function compatibility table

■ Configurable I/O

Functions which are not listed in this table are fully compatible.

Stop functions have priority over run commands.

The selection of functions is limited by:

- The number of drive I/O
- The incompatibility of certain functions with one another
